

SSL, JEPA, World Models and the Future of AI

Yann Le Cun

New York University

Meta – Fundamental AI Research

NYU CDS
2025-09-10

We Need Human-Level AI for Intelligent Assistant

- ▶ In the near future, all of our interactions with the digital world will be mediated by AI assistants.
- ▶ Intelligent assistants that can help us in our daily lives
- ▶ Smart glasses
 - ▶ Communicates through voice, vision, display, EMG...
- ▶ We need machines with human-level intelligence
 - ▶ Machines that understand how the world works
 - ▶ Machines that can remember
 - ▶ Machines that can reason and plan.

"Her"
(2013)

Meta Orion
(2024)

The Ubiquitous AI Assistant is Becoming A Reality

- ▶ Ray-Ban Meta (today)
- ▶ Cameras / microphone / speakers
- ▶ no display
- ▶ Voice interface to Meta AI assistant

But Machine Learning Sucks! (compared to humans and animals)

- ▶ Supervised learning (SL) requires large numbers of labeled samples.
- ▶ Reinforcement learning (RL) requires insane amounts of trials.
- ▶ Self-Supervised Learning (SSL) works great but...
- ▶ Generative prediction only works for text and other discrete modalities

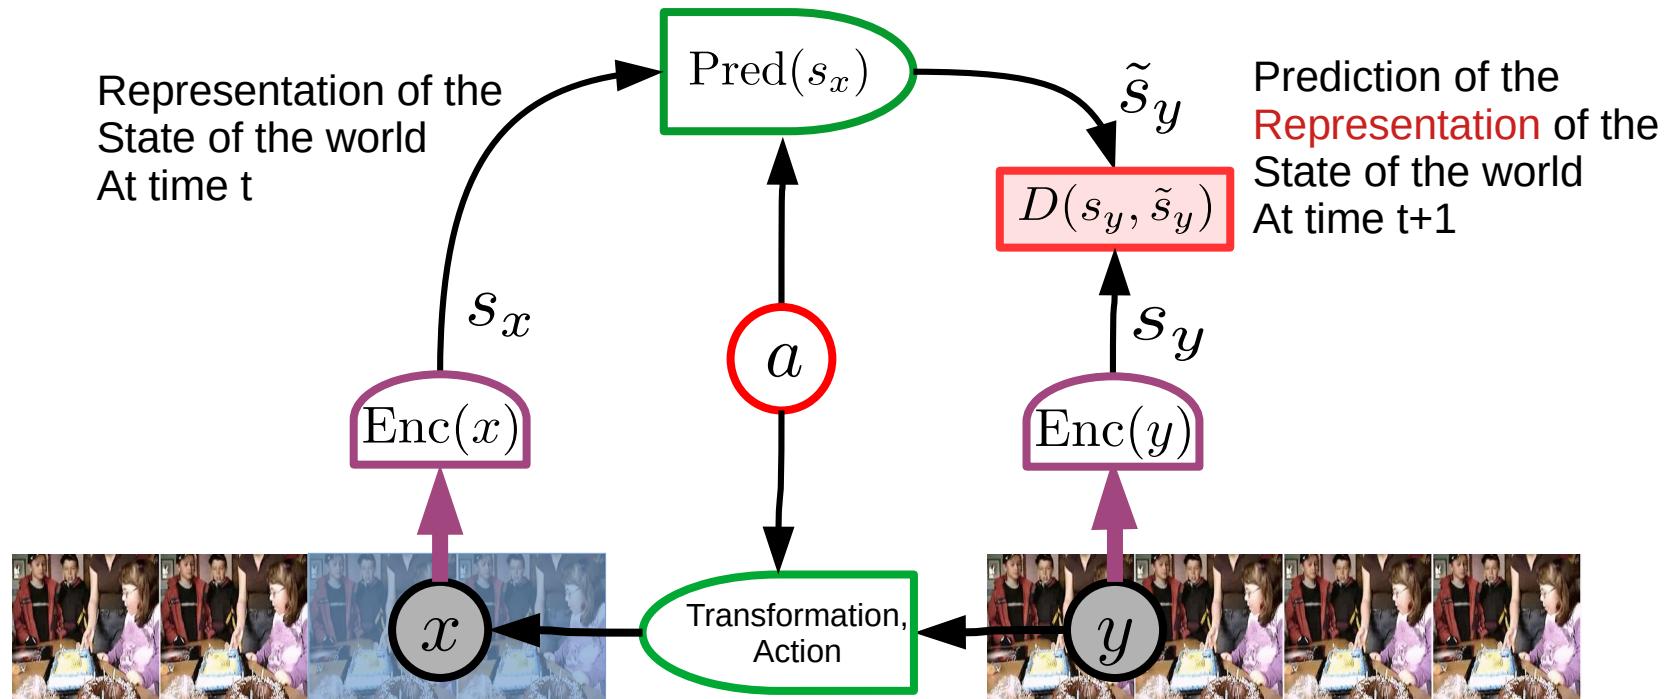

- ▶ Animals and humans:
 - ▶ Can learn new tasks **very** quickly.
 - ▶ Understand how the world works
 - ▶ Can reason and plan
- ▶ Humans and animals have common sense
- ▶ Their behavior is driven by objectives (drives)

What's a universal foundation model architecture

- ▶ **Captures structure in the data**
 - ▶ Discovers dependencies in a task-independent way
- ▶ **Trained with Self-Supervised Learning (SSL)**
 - ▶ No need for labels
- ▶ **Learns abstract representations in the data**
 - ▶ Representations that allow to make predictions
- ▶ **Learns a predictive model**
 - ▶ Observation x , transformed observation $y = \text{Trans}(x, a)$
 - ▶ Encoding : representations $s_x = \text{Enc}(x)$, $s_y = \text{Enc}(y)$
 - ▶ Prediction of s_y : $p_y = \text{Pred}(s_x, a)$

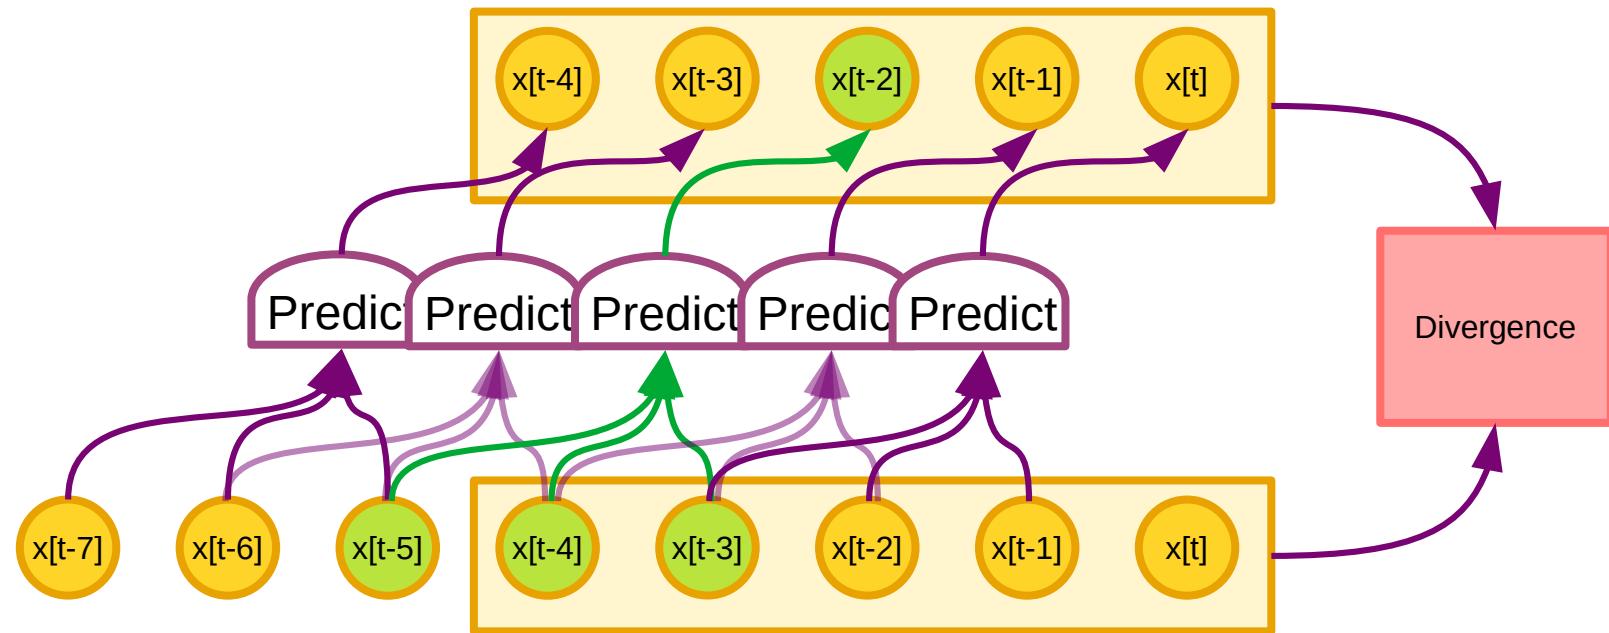

Predictive Model with JEPA

- ▶ Joint Embedding Predictive Architecture (JEPA)
- ▶ [LeCun 2022], [Garrido 2023], [Bardes 2023], [Assran 2023], [Garrido 2024]

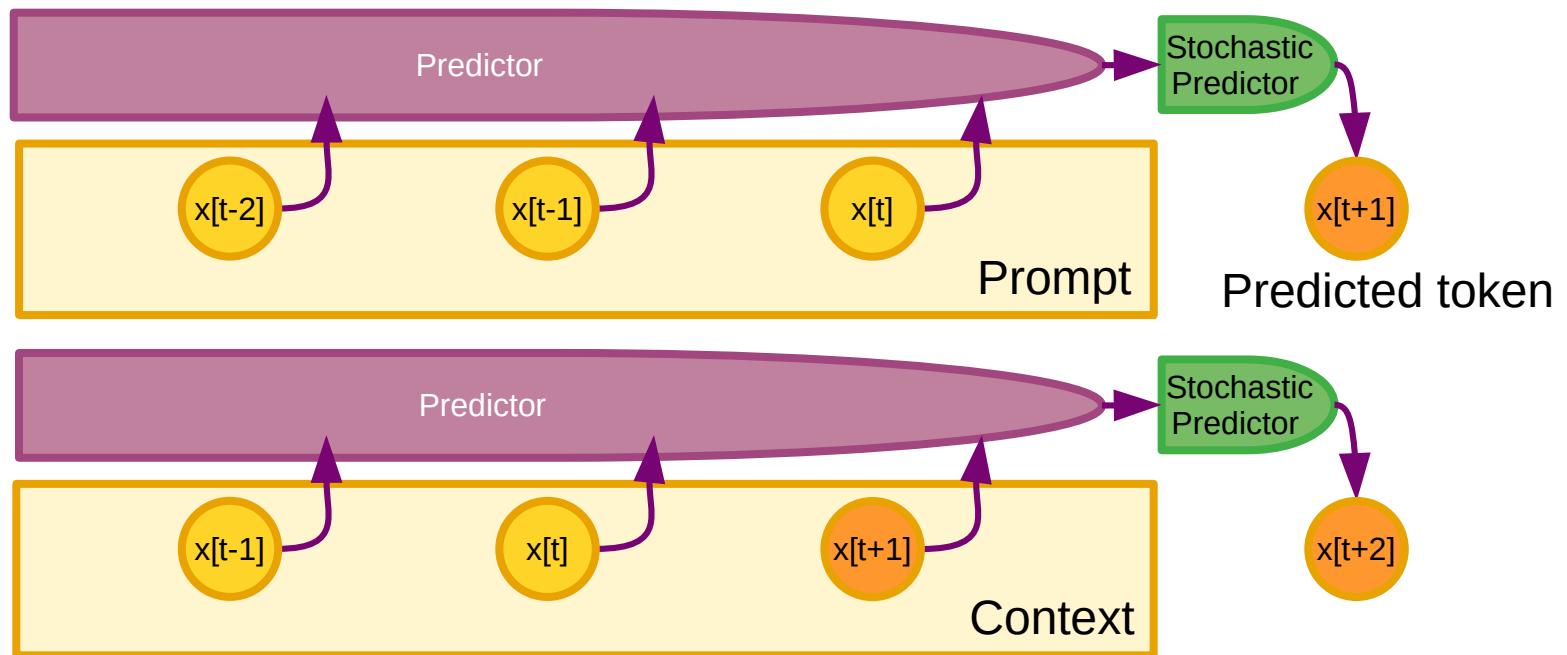

AE Collapse Prevention through Architectural Constraints

- ▶ Train an auto-encoder with **causal connections**
- ▶ No connection between an input and its corresponding output
- ▶ LLMs / GPT architectures are the most popular example
- ▶ Trained to predict the next input.

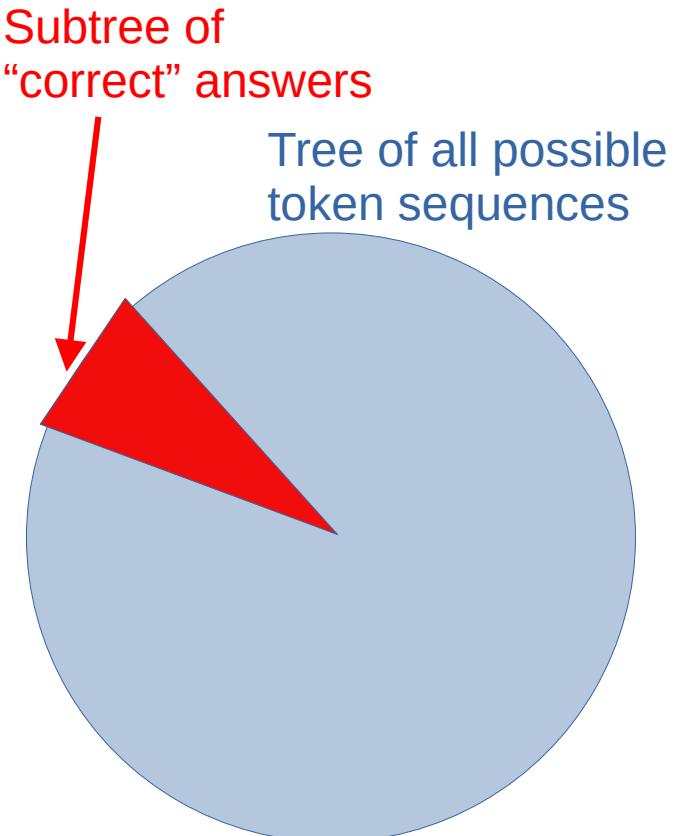

Auto-Regressive LLM. Inject predicted token in the input

- ▶ Outputs one token after another through feed-forward prediction
- ▶ Tokens may represent words, image patches, speech segments...
- ▶ Predictor has a fixed number of layers
- ▶ Only works for discrete domains (text, DNA....)

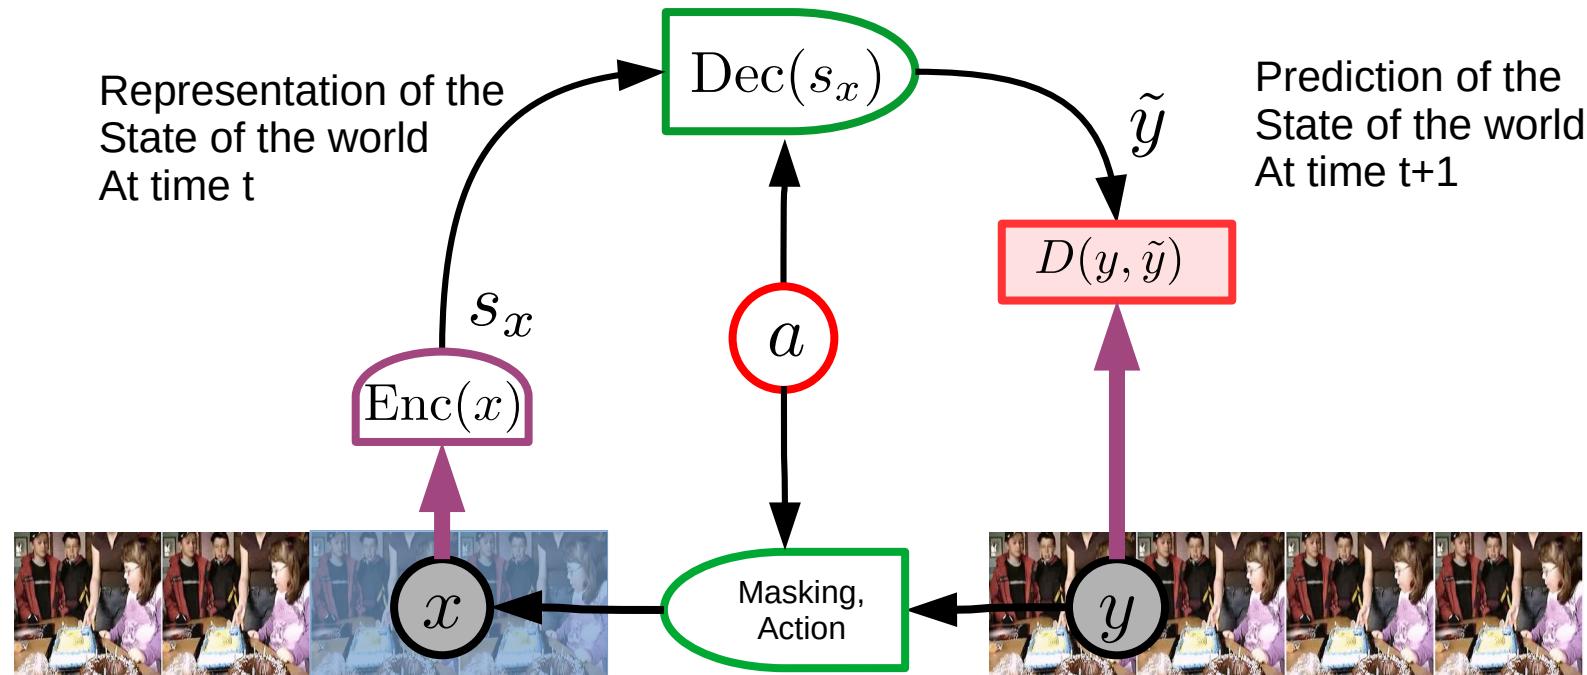

Auto-Regressive Generative Models Suck!

- ▶ Auto-Regressive LLMs are **doomed**.
- ▶ They cannot be made factual, non-toxic, etc.
- ▶ They are not controllable
- ▶ Probability e that any produced token takes us outside of the set of correct answers
- ▶ Probability that answer of length n is correct (assuming independence of errors):
 - ▶ $P(\text{correct}) = (1-e)^n$
- ▶ **This diverges exponentially.**
- ▶ **It's not fixable (without a major redesign).**
- ▶ See also [Dziri...Choi, ArXiv:2305.18654]

Can we train Generative Architecture with Continuous Data?

- ▶ Short answer: **NO!!!**
- ▶ It works for discrete domains, not high-dim domains
- ▶ Generative world model architecture

This is a [...] of text extracted
[...] a large set of [...] articles

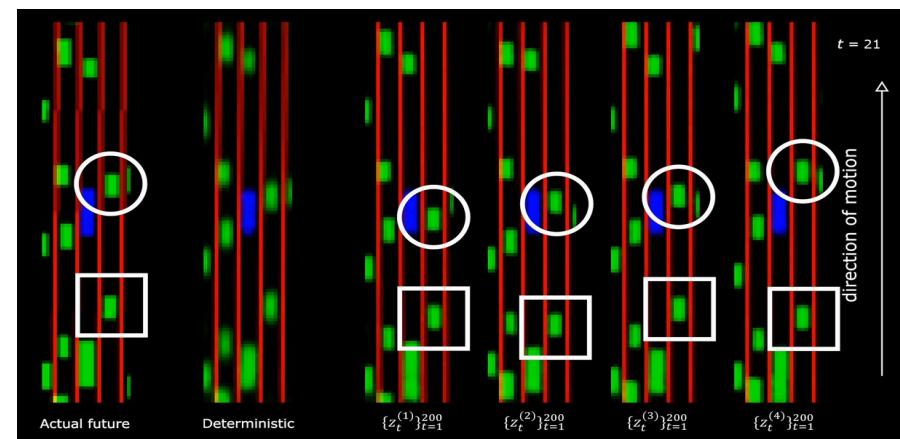

This is a piece of text extracted
from a large set of news articles

Generative Architectures DO NOT Work for Images and video

- ▶ Because the world is only partially predictable
- ▶ A predictive model should represent multiple predictions
- ▶ Probabilistic models are intractable in high-dim continuous domains.
- ▶ Generative Models must predict every detail of the world

- ▶ My solution: Joint-Embedding Predictive Architecture

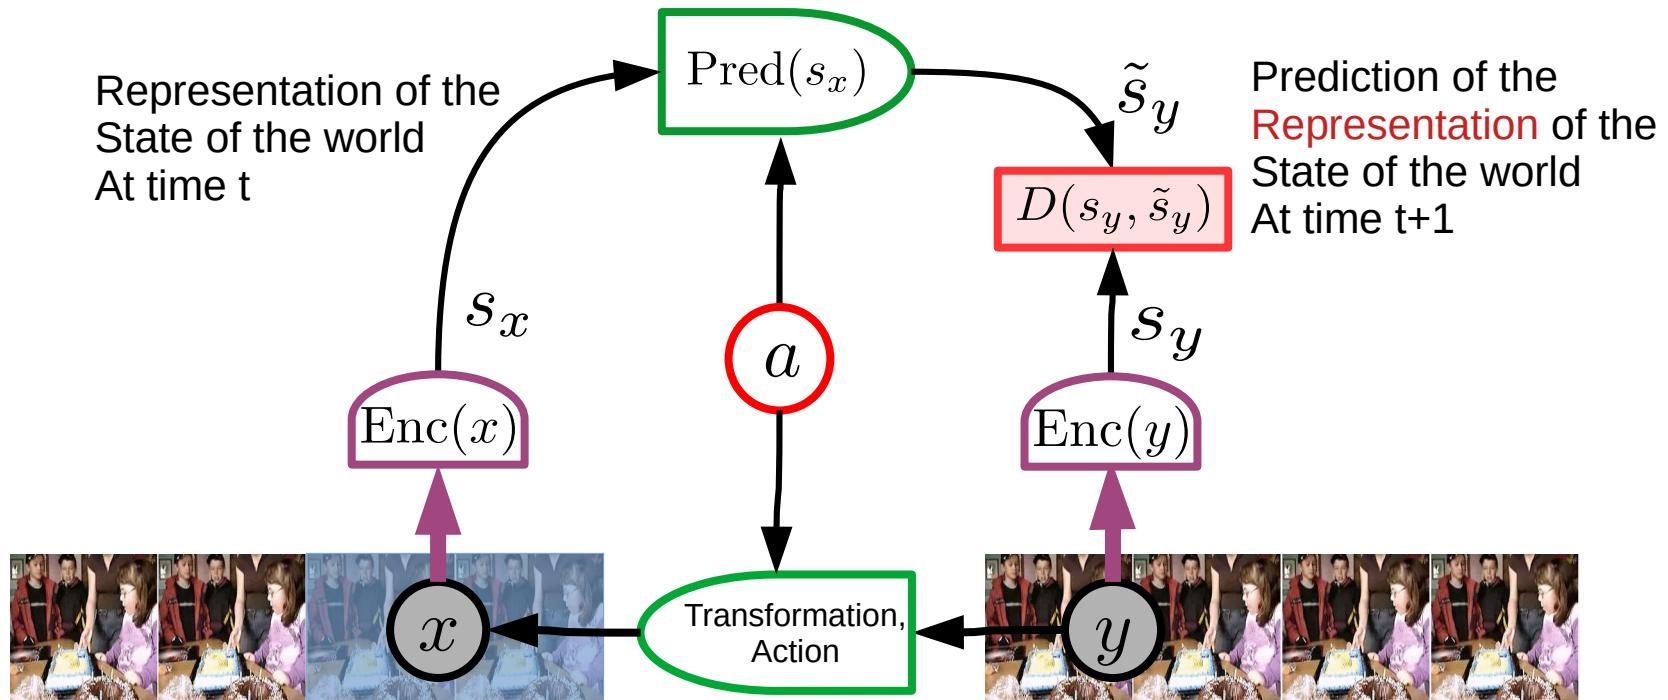

[Mathieu,
Couprie,
LeCun
ICLR 2016]

[Henaff, Canziani, LeCun ICLR 2019]

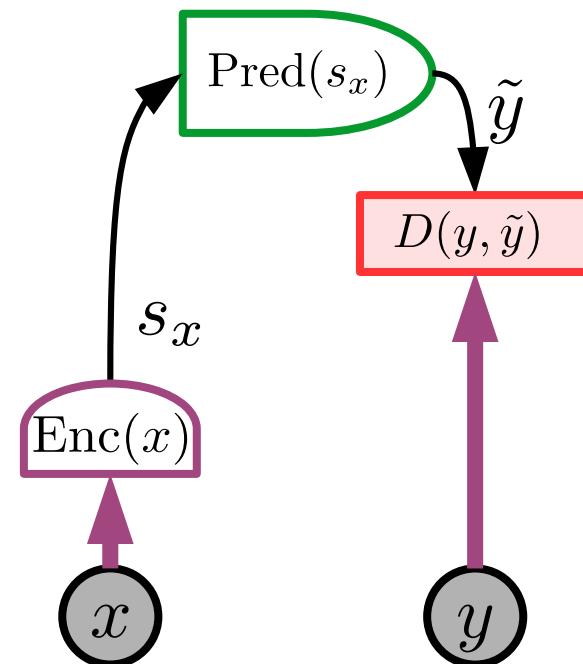

Joint Embedding World Model: Self-Supervised Training

- ▶ Joint Embedding Predictive Architecture (JEPA)
- ▶ [LeCun 2022], [Garrido 2023], [Bardes 2023], [Assran 2023], [Garrido 2024]

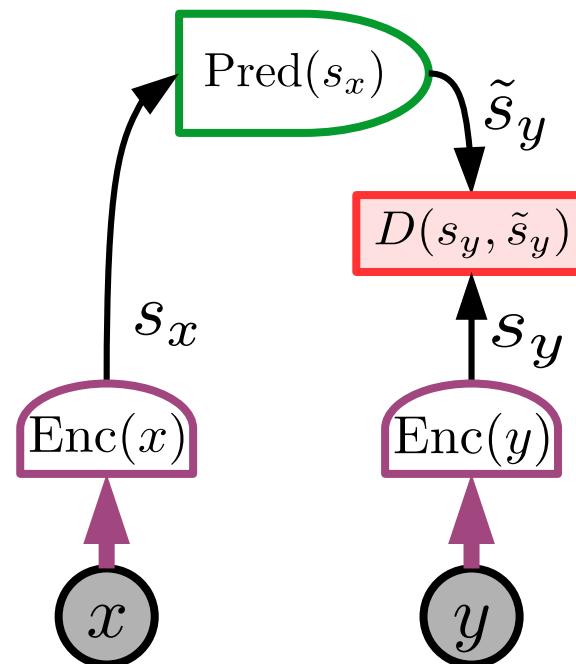

Architectures: Generative vs Joint Embedding

- ▶ **Generative:** predicts y (with all the details, including irrelevant ones)
- ▶ **Joint Embedding:** predicts an **abstract representation** of y
- ▶ **JEPA lifts the abstraction level**, generative architectures do not.

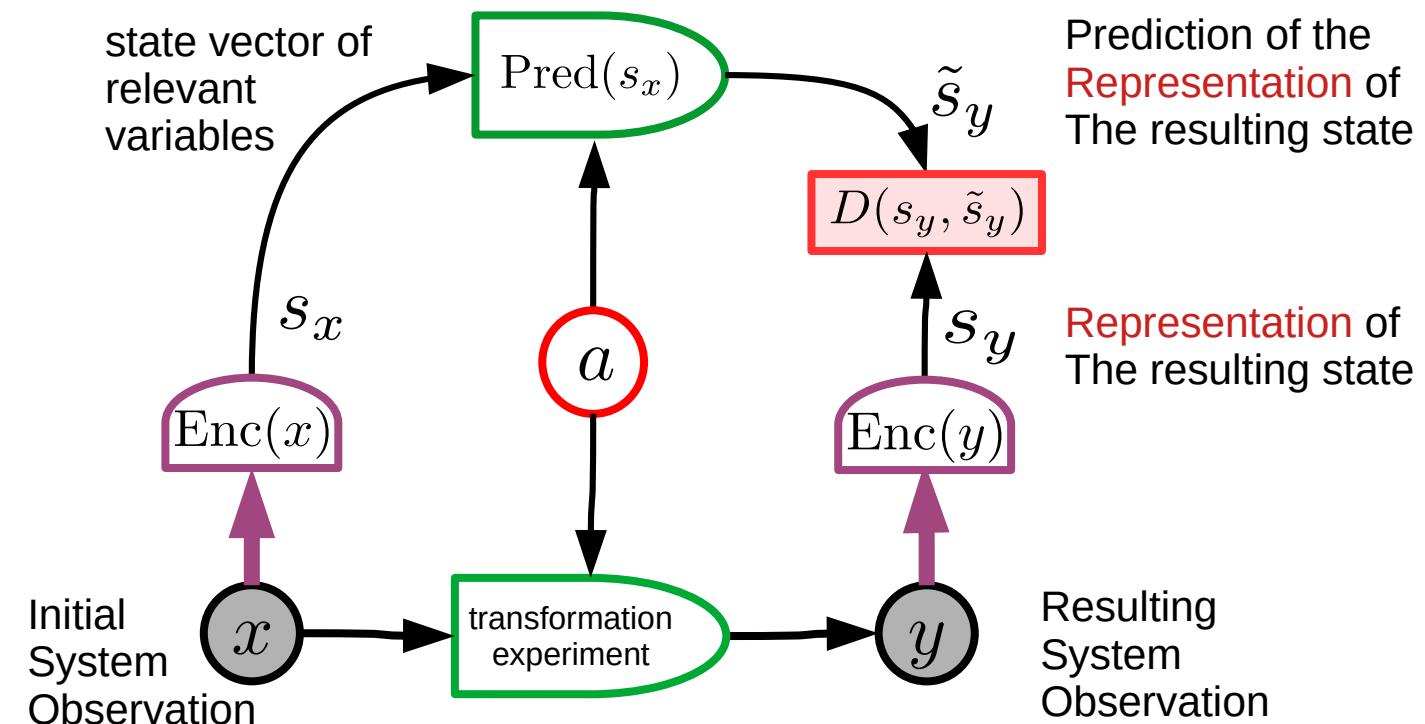

a) Generative Architecture
Examples: VAE, MAE...

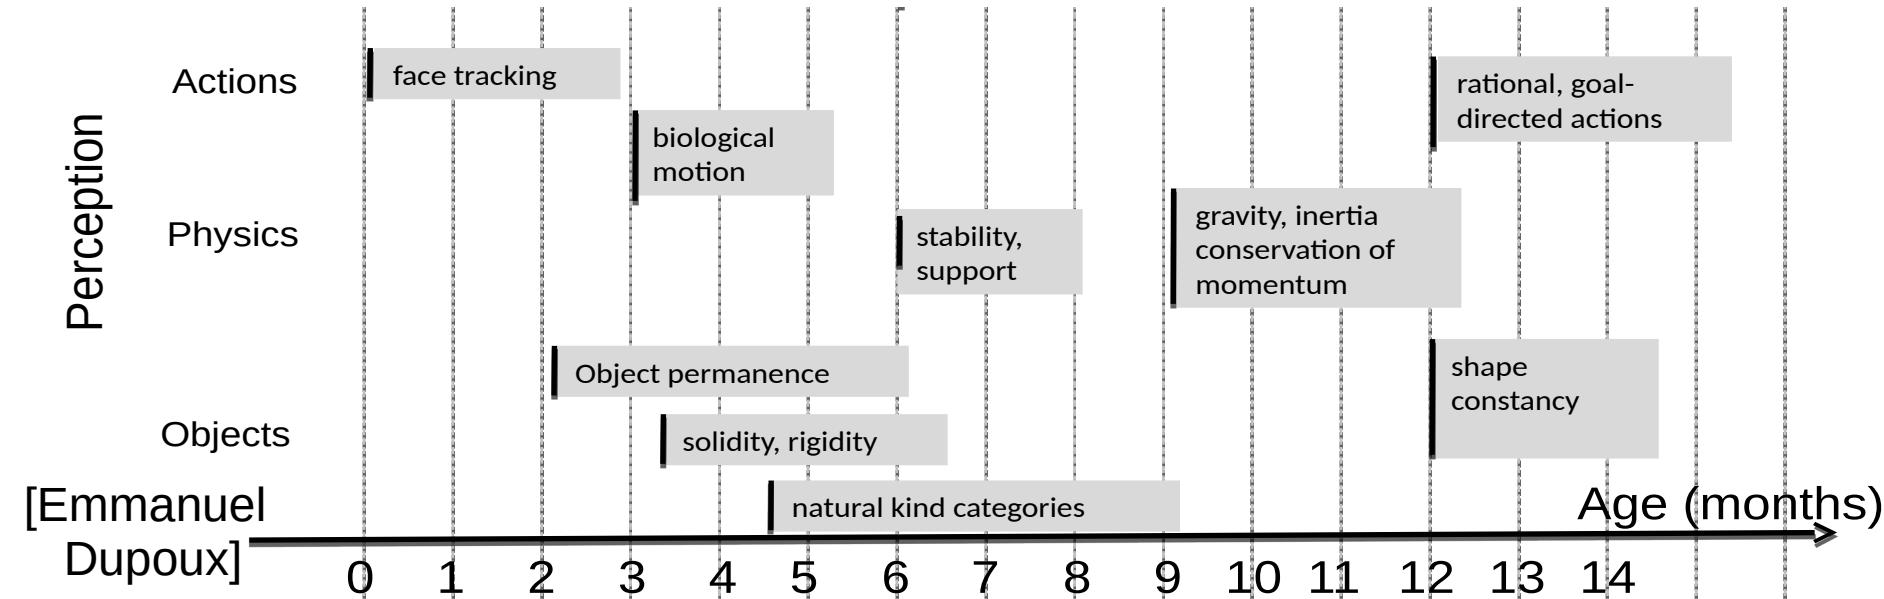

b) Joint Embedding Architecture

This is how models are built in traditional physics

- ▶ Find an **abstract state representation** that allows to make predictions
- ▶ Extract the state representation from observation/measurement
- ▶ Predict outcome resulting from an intervention/experiment
- ▶ Irrelevant and unpredictable information is eliminated from the representation
- ▶ The representation contains information that makes prediction possible

How do babies learn how the world works?

▶ How do we get machines to learn like babies?

Current architectures are missing something really big!

- ▶ Never mind humans, cats and dogs can do amazing feats
 - ▶ Current robots intelligence doesn't come anywhere close
- ▶ Any **house cat** can plan highly complex actions
- ▶ Any **10 year-old** can clear up the dinner table and fill up the dishwasher **without learning** ("zero-shot")
- ▶ Any **17 year-old** can learn to drive a car in 20 hours of practice
- ▶ AI systems that can pass the bar exam, do math problems, prove theorems....
- ▶ ...but where are my Level-5 self-driving car and my domestic robot?
- ▶ We keep bumping into Moravec's paradox
 - ▶ Things that are easy for humans are difficult for AI and vice versa.

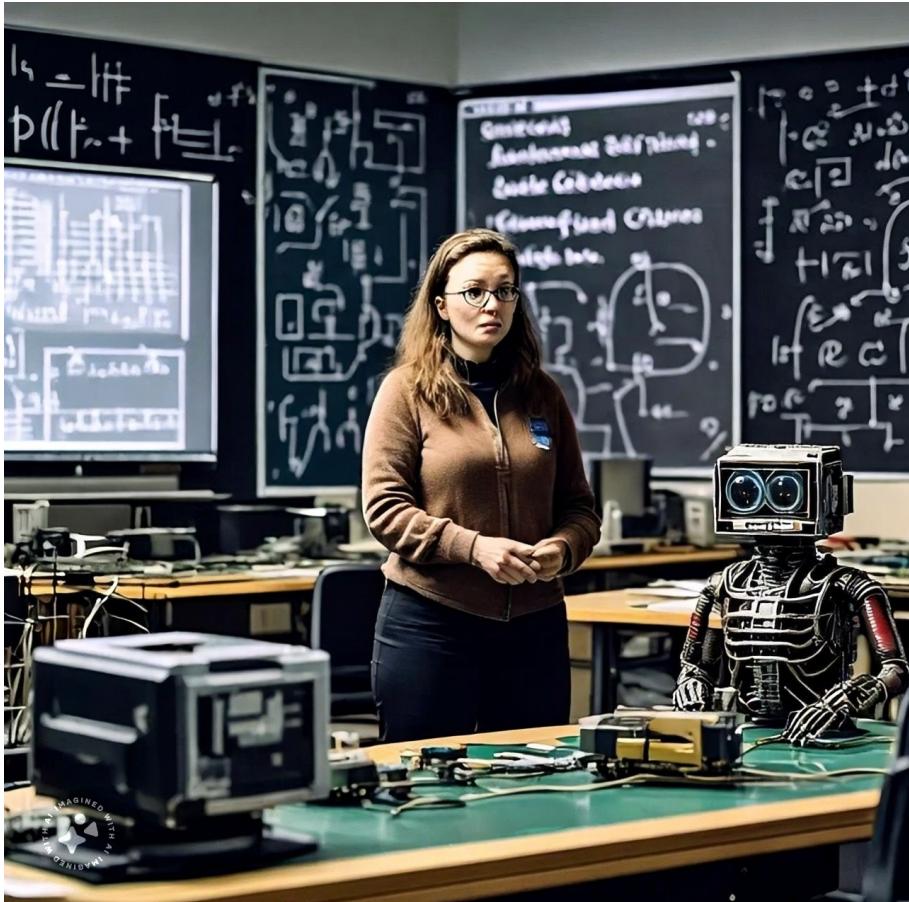

Our world model needs to be trained from sensory inputs

- ▶ **LLM**
 - ▶ Trained on $3.0E13$ tokens ($2E13$ words). Each token is 3 bytes.
 - ▶ **Data volume: $0.9E14$ bytes.**
 - ▶ Would take 450,000 years for a human to read (12h/day, 250 w/minute)
- ▶ **Human child**
 - ▶ 16,000 wake hours in the first 4 years (30 minutes of YouTube uploads)
 - ▶ 2 million optical nerve fibers, carrying about 1 byte/sec each.
 - ▶ **Data volume: $1.1E14$ bytes**
- ▶ **A four year-old child has seen more data than an LLM !**

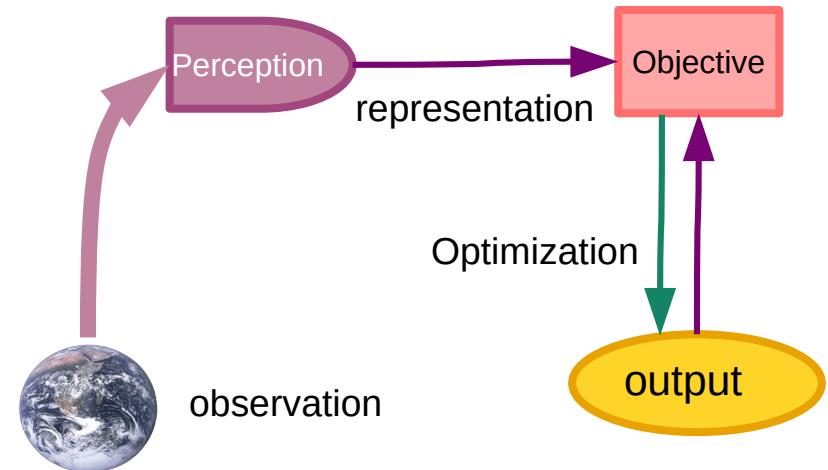

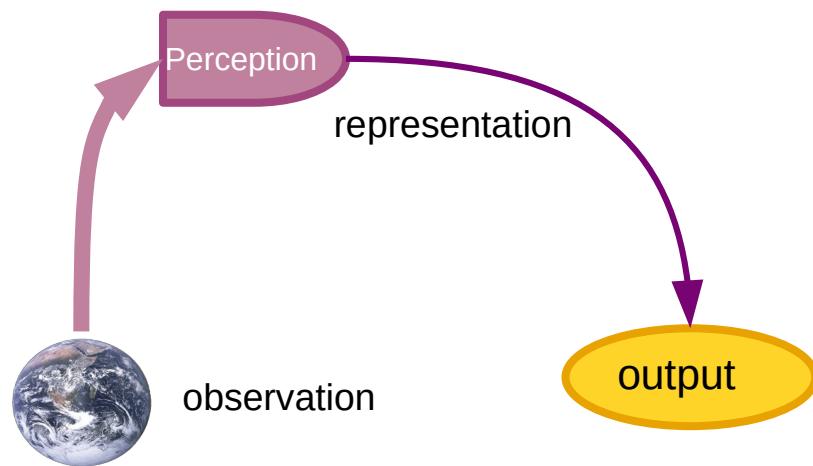

Desiderata for AMI (Advanced Machine Intelligence)

- ▶ **Systems that learn world models from sensory inputs**
 - ▶ E.g. learn intuitive physics from video
- ▶ **Systems that have persistent memory**
 - ▶ Large-scale associative memories
- ▶ **Systems that can plan actions**
 - ▶ So as to fulfill an objective
- ▶ **Systems that can reason**
 - ▶ Inventing new solutions to unseen problems
- ▶ **Systems that are controllable & safe**
 - ▶ By design, not by fine-tuning.

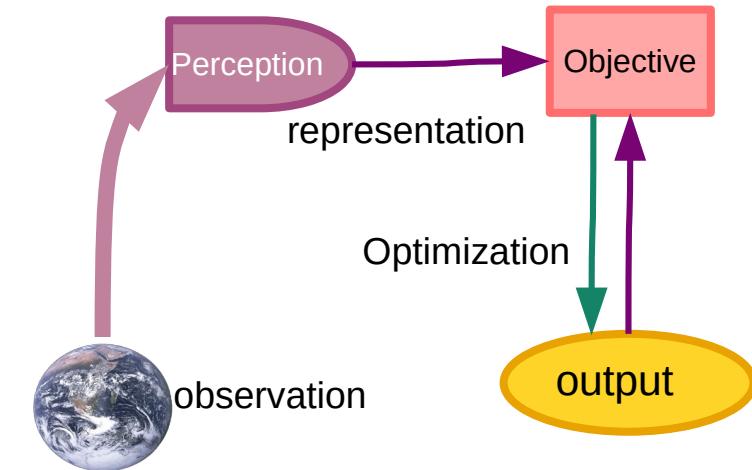

Inference: feed-forward propagation vs optimization

- ▶ What is reasoning and planning?
- ▶ Feed-forward propagation is insufficient
- ▶ Complex inference requires the **optimization** of an **objective**
- ▶ Every computational problem can be reduced to optimization
 - ▶ This includes every inference and planning problem.
- ▶ **Energy-Based Model**

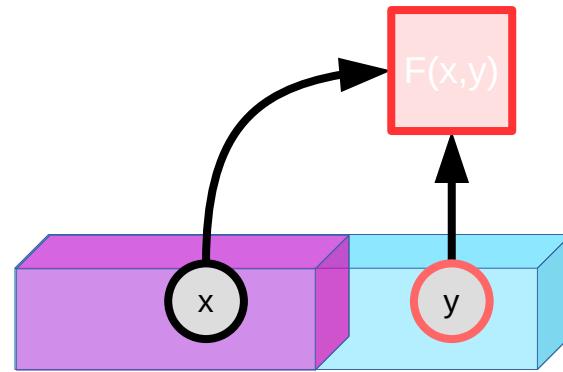

Inference through optimization: Objective-Driven AI.

- ▶ Inference through optimization is used in classical methods
 - ▶ Probabilistic graphical models, Bayesian nets
 - ▶ Model-Predictive Control in robotics
 - ▶ Search & planning in “classical” AI
- ▶ In the past, **all of AI** was viewed as a search or optimization problem
 - ▶ Path planning, Block World, Towers of Hanoi, SAT, logical inference
- ▶ Optimization-based inference enables zero-shot “learning”
 - ▶ It can find innovative solutions to unseen problems.
 - ▶ All game-playing AI systems use search/planning
- ▶ Optimization-based inference is “System 2”

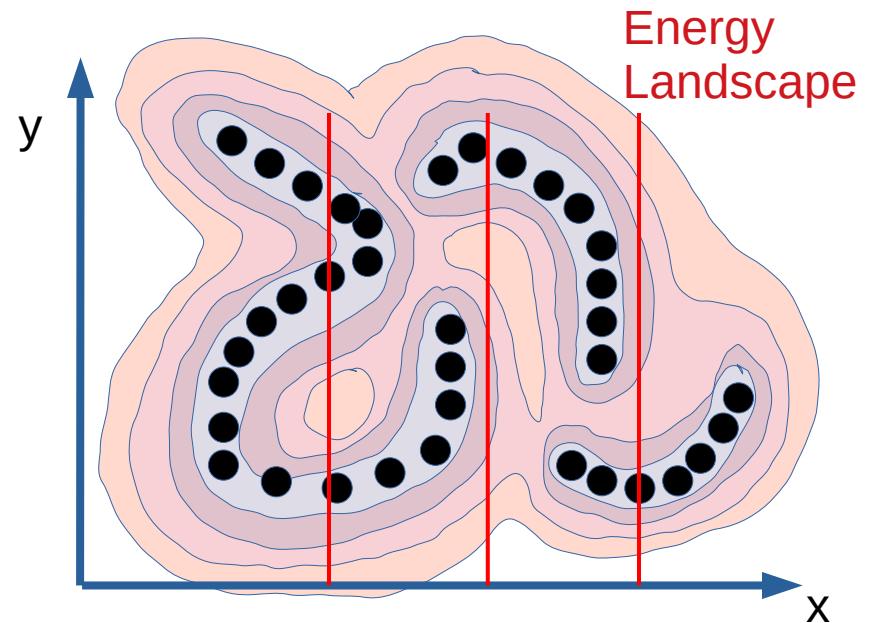

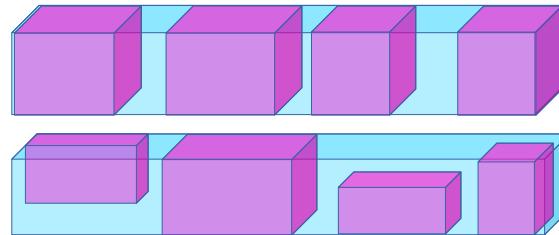

Capturing Dependencies with Energy-Based Models

- ▶ The only way to formalize & understand all model types
- ▶ Gives low energy to compatible pairs of x and y
- ▶ Gives higher energy to incompatible pairs

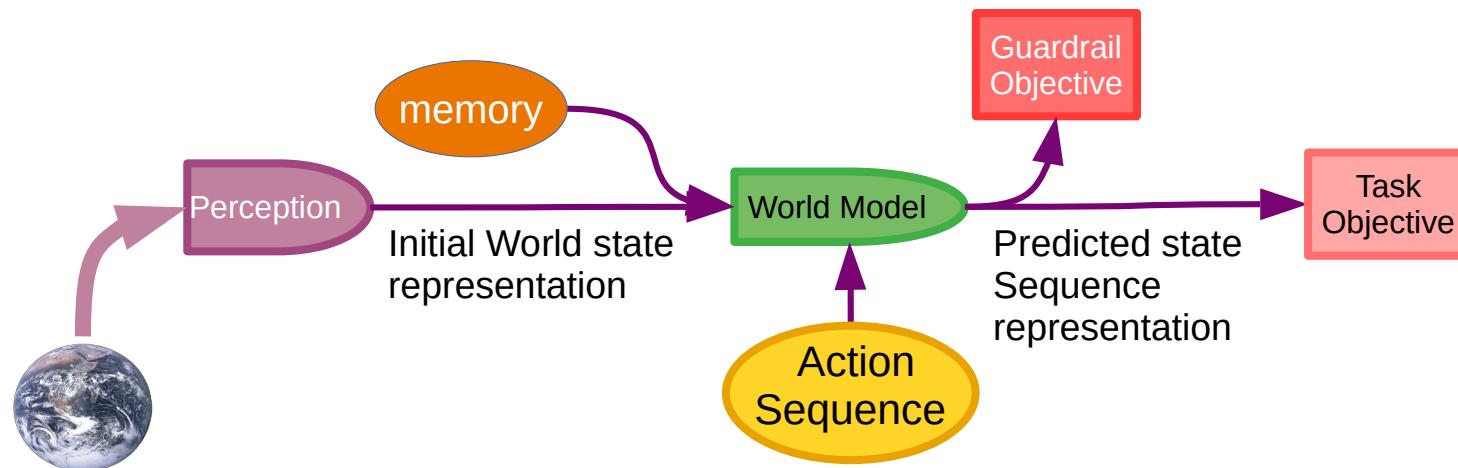

time or space →

$$\check{y} = \operatorname{argmin}_y F(x, y)$$

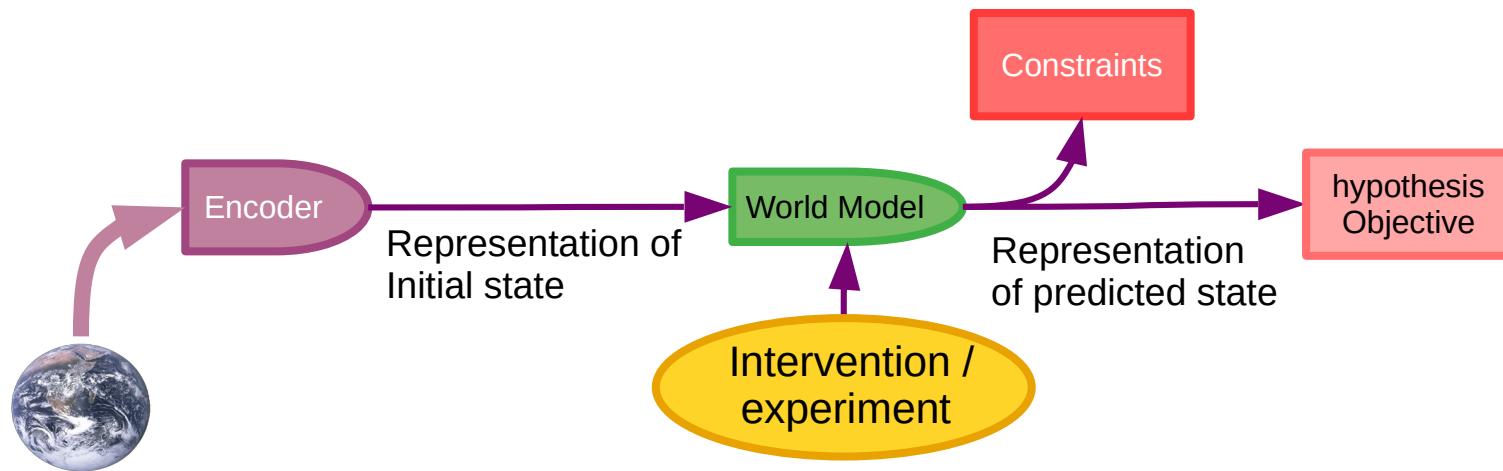

2. World Model for Planning/Reasoning

- ▶ **Perception:** Computes an abstract representation of the state of the world
 - ▶ Possibly combined with previously-acquired information in memory
- ▶ **World Model:** Predict the state resulting from an imagined action sequence
- ▶ **Task Objective:** Measures divergence to goal
- ▶ **Guardrail Objective:** Immutable objective terms that ensure safety
- ▶ **Operation:** Finds an action sequence that minimizes the objectives

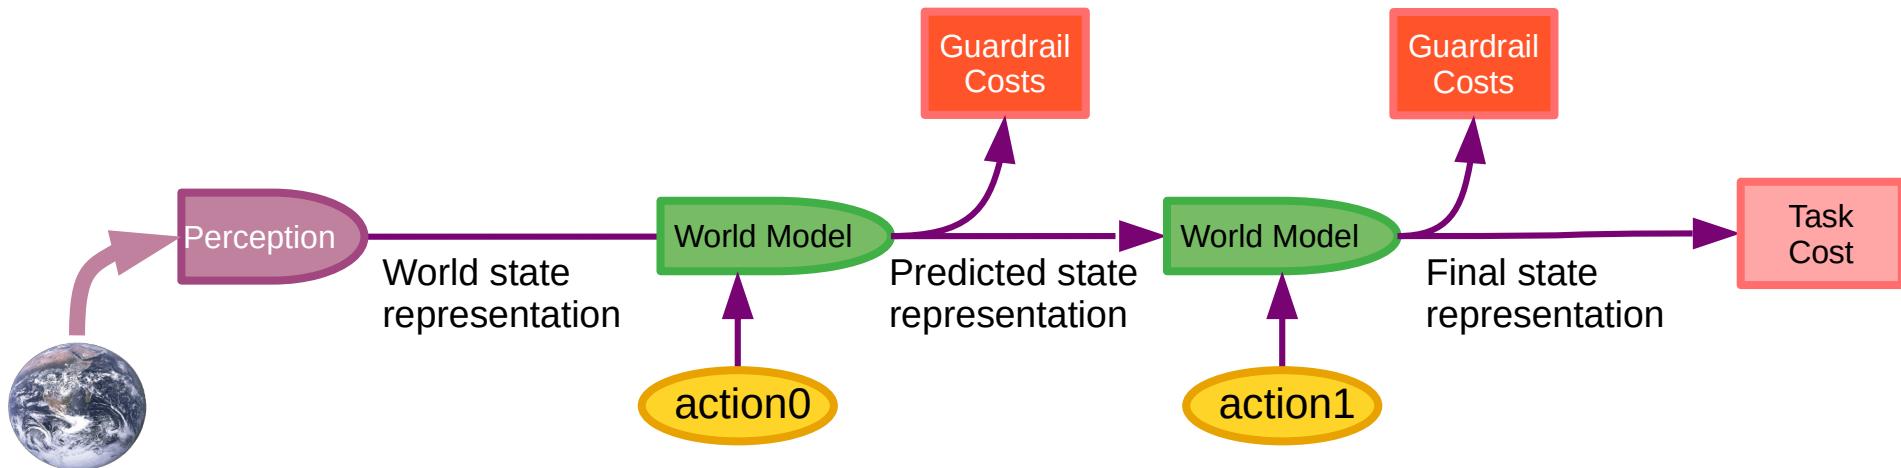

2. Models for Physics Experiments

- ▶ **Encoder:** Computes an abstract representation of the state of the system
- ▶ **World Model:** Predict the state resulting from an imagined experiment or intervention.
- ▶ **Hypothesis Objective:** Measures divergence to the result expected from the experiment
- ▶ **Constraints:** that the trajectory must satisfy.
- ▶ **Find an action an experiment that validates or invalidates the hypothesis**

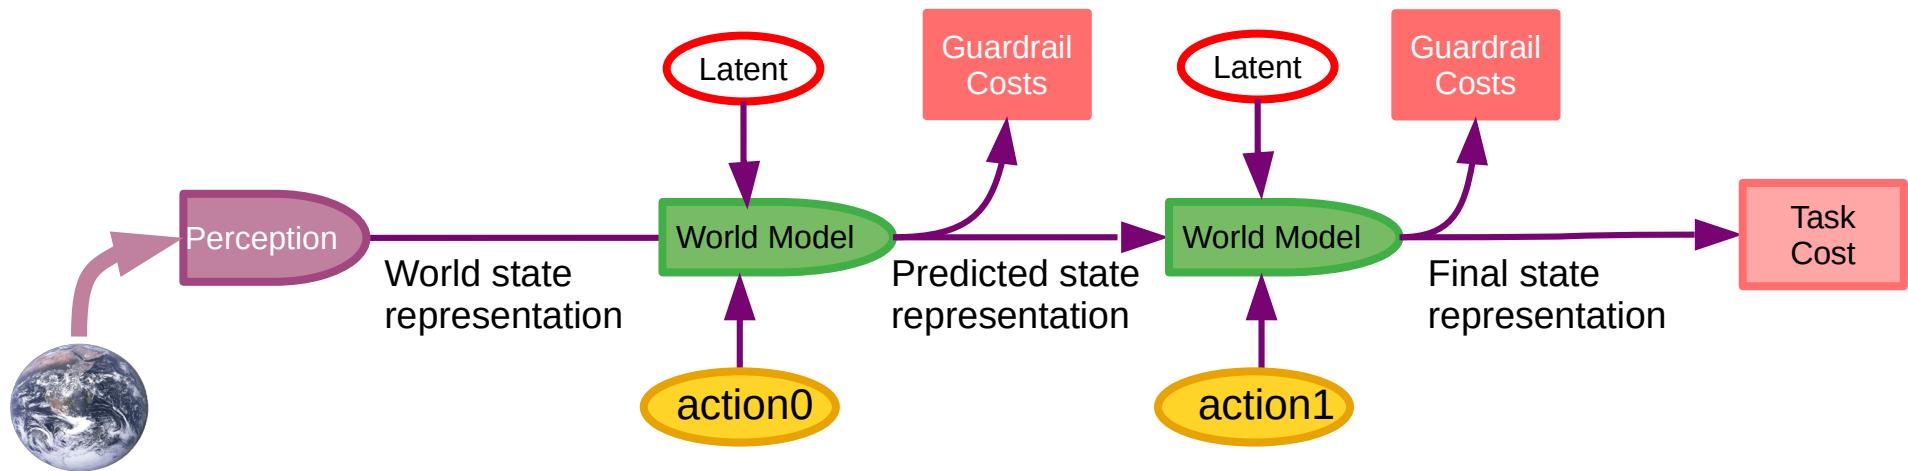

Objective-Driven AI: Multistep/Recurrent World Model

- ▶ Same world model applied at multiple time steps
- ▶ Guardrail costs applied to entire state trajectory
- ▶ This is identical to **Model Predictive Control (MPC)**
 - ▶ But with a trained world model
- ▶ Action inference by minimization of the objectives
 - ▶ Using gradient-based method, graph search, dynamic prog, A*, MCTS,....

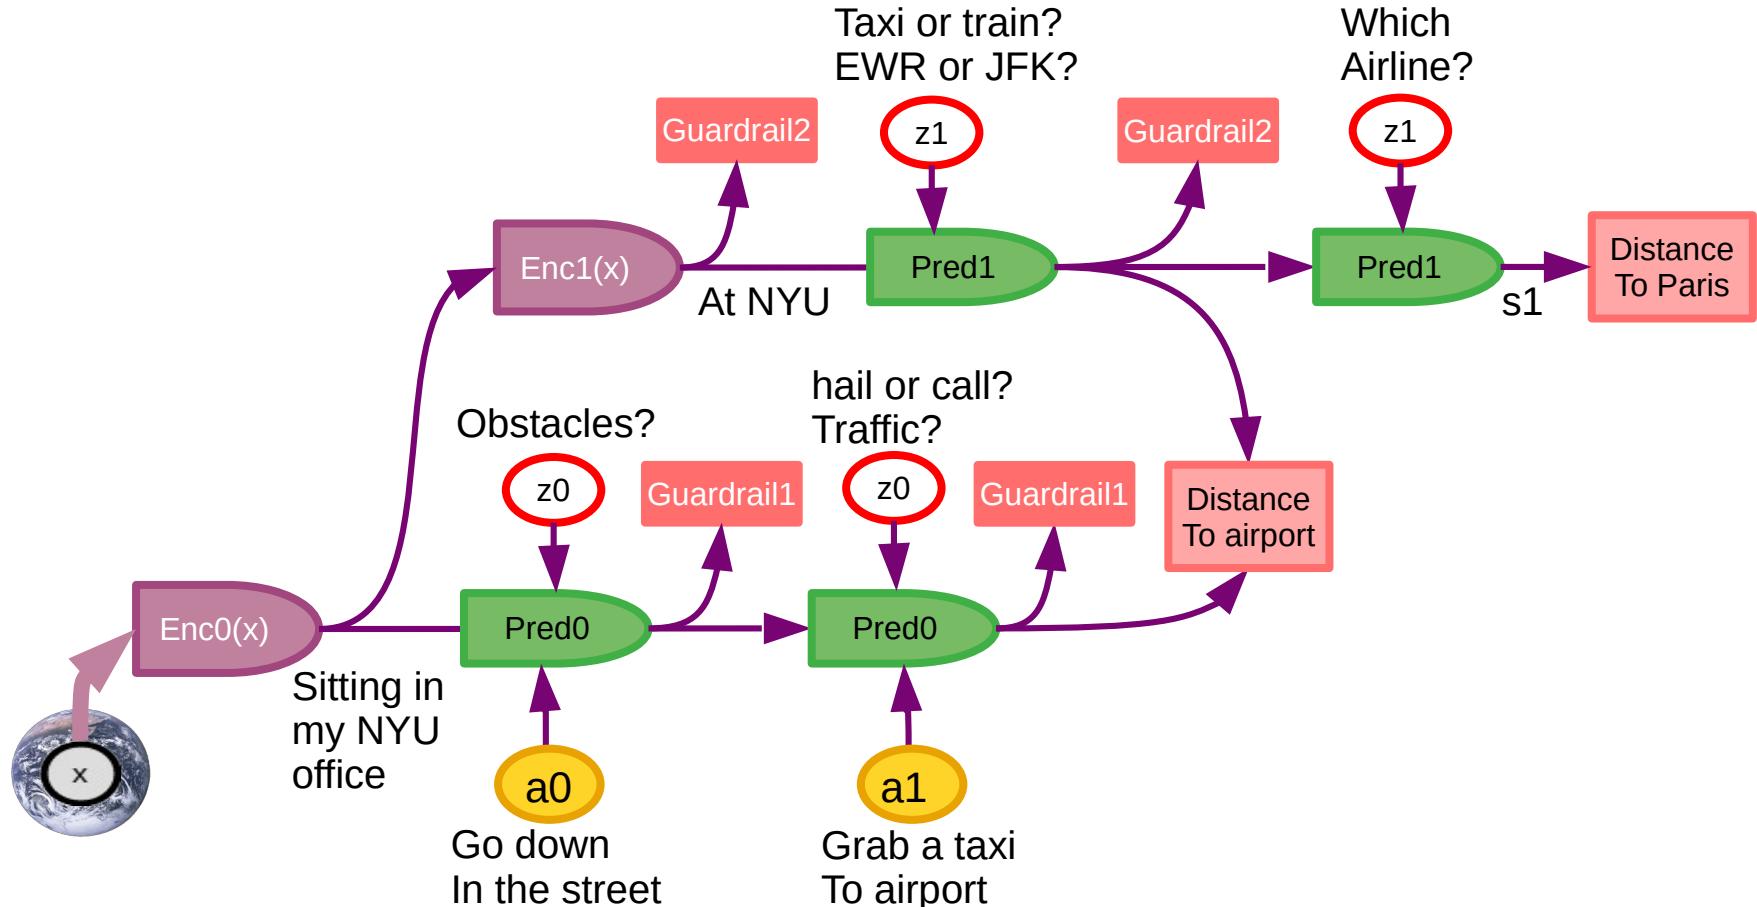

Objective-Driven AI: Non-Deterministic World Model

- ▶ The world is not deterministic or fully predictable
- ▶ Latent variables parameterize the set of plausible predictions
- ▶ Can be sampled from a prior or swept through a set.
- ▶ Planning can be done for worst case or average case
- ▶ Uncertainty in outcome can be predicted and quantified

Objective-Driven AI: Hierarchical Planning

► Hierarchical Planning: going from NYU to Paris

Objective-Driven AI Systems

AI that can learn, understand the world,
reason, plan,
Yet is safe and controllable

“A path towards autonomous machine intelligence”

<https://openreview.net/forum?id=BZ5a1r-kVs>

[previous versions of this talk available on YouTube]

Modular Cognitive Architecture for AMI

► Configurator

- ▶ Configures other modules for task

► Perception

- ▶ Estimates state of the world

► World Model

- ▶ Predicts future world states

► Cost

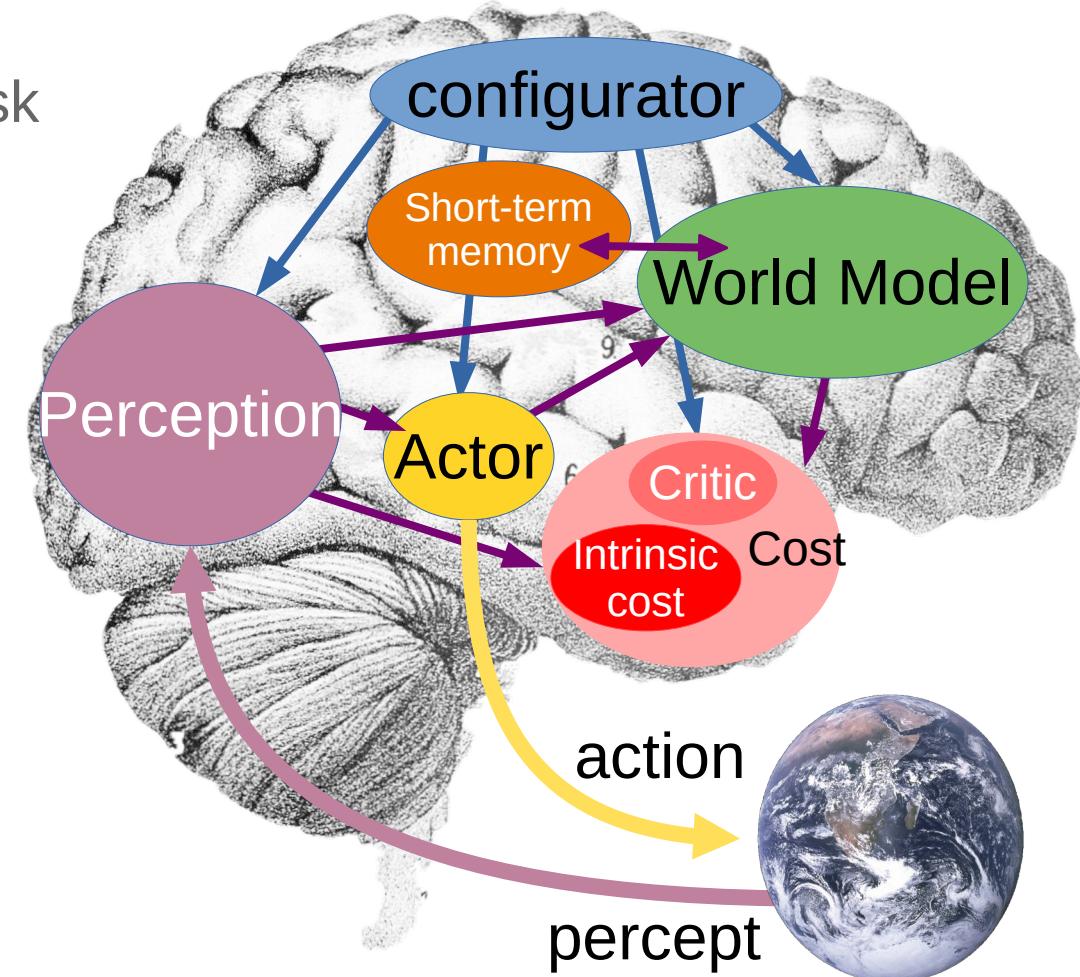

- ▶ Compute “discomfort”

► Actor

- ▶ Find optimal action sequences

► Short-Term Memory

- ▶ Stores state-cost episodes

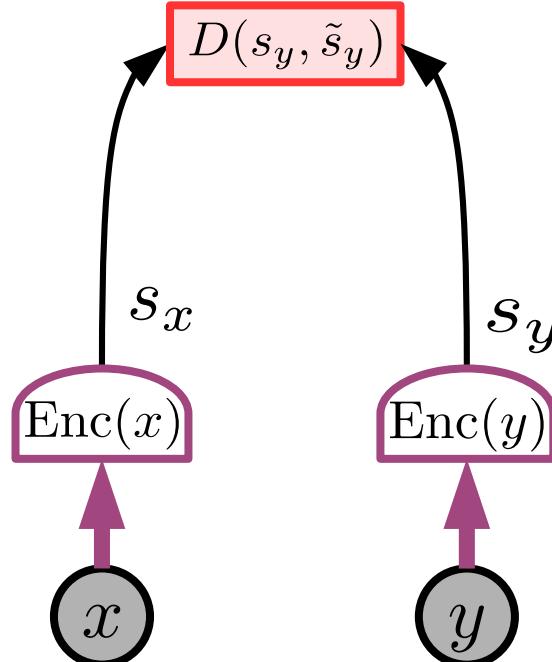

How could Machines Learn World Models from Observations?

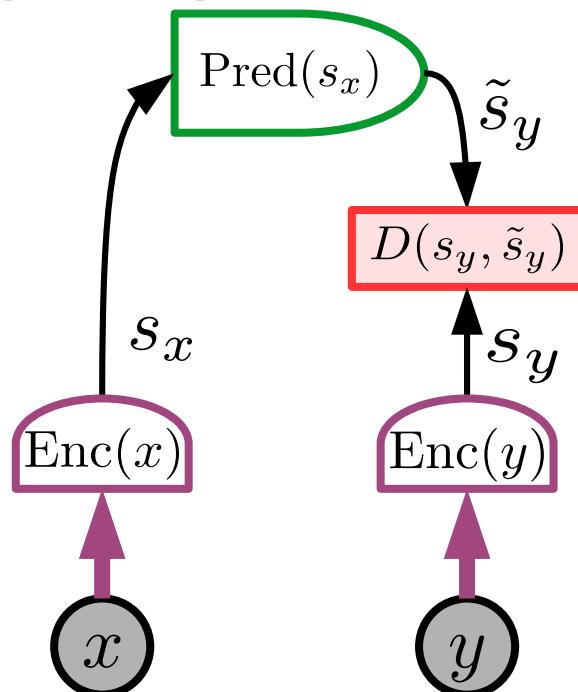

Self-Supervised Learning

Joint Embedding Architectures

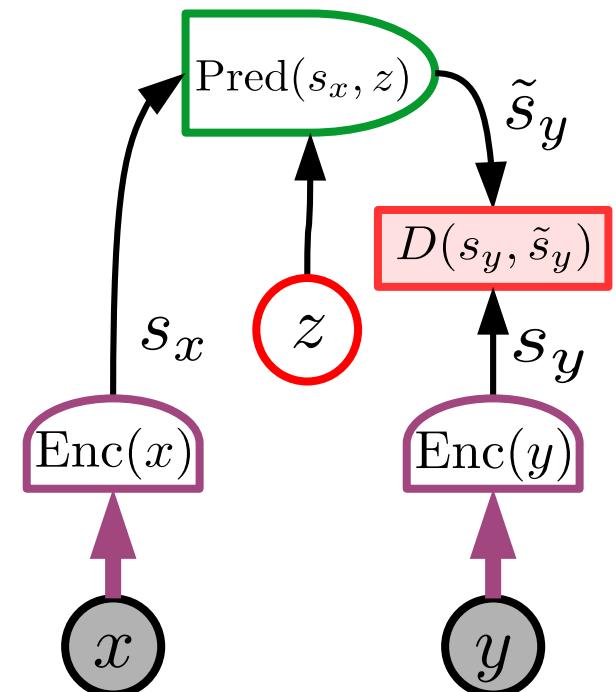

- ▶ Computes abstract representations for x and y
- ▶ Tries to make them equal or predictable from each other.

a) Joint Embedding Architecture (JEA)
Examples: Siamese Net, Pirl, MoCo,
SimCLR, Barlow Twins, VICReg,

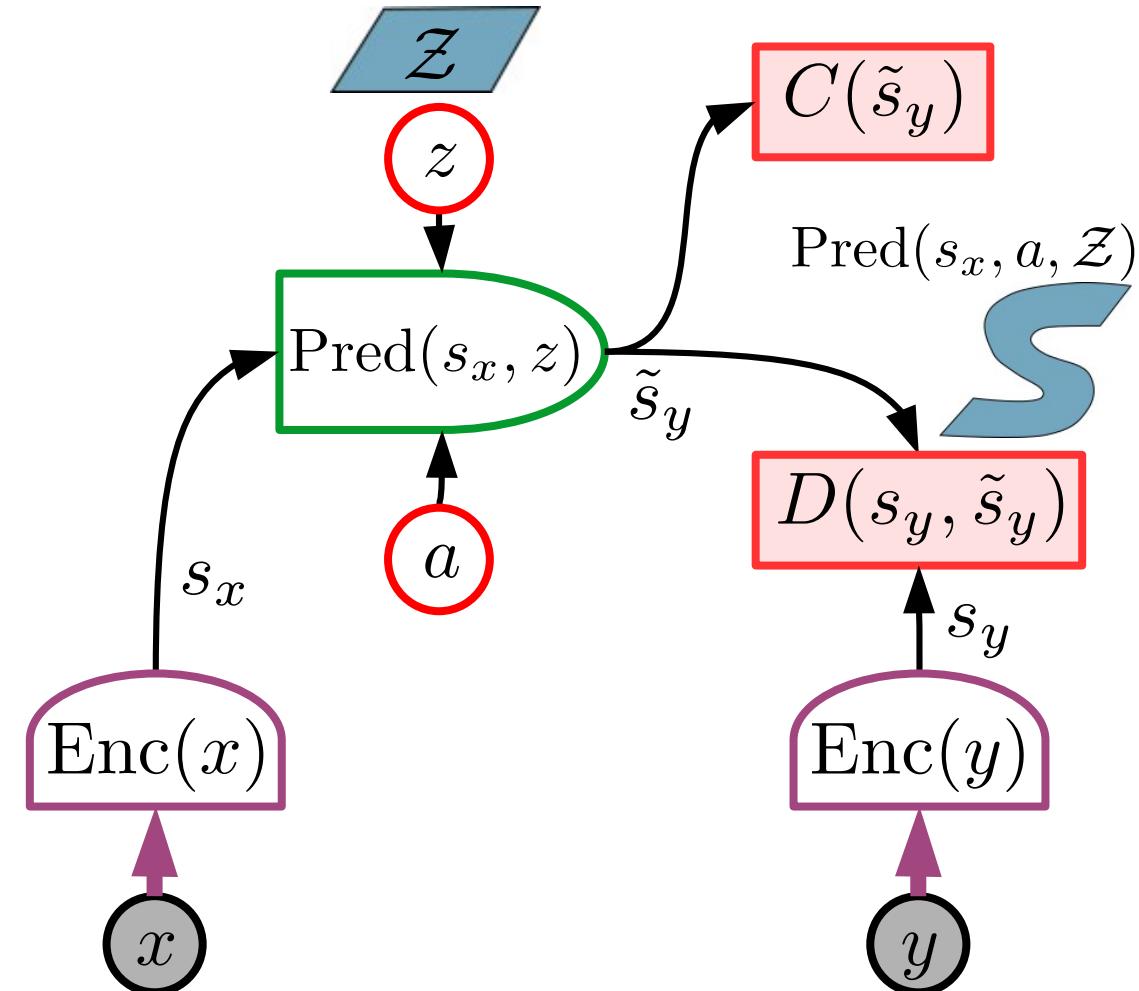

b) Deterministic Joint Embedding
Predictive Architecture (DJEPA)
Examples: BYOL, VICRegL, I-JEPA

c) Joint Embedding Predictive
Architecture (JEPA)
Examples: Equivariant VICReg
I-JEPA.....

Architecture for action-conditioned world models: JEPA

- ▶ JEPA: Joint Embedding Predictive Architecture.
- ▶ x : observed past and present
- ▶ y : future
- ▶ a : action
- ▶ z : latent variable (unknown)
- ▶ $D(\cdot)$: prediction cost
- ▶ $C(\cdot)$: surrogate cost
- ▶ JEPA predicts a representation of the future S_y from a representation of the past and present S_x

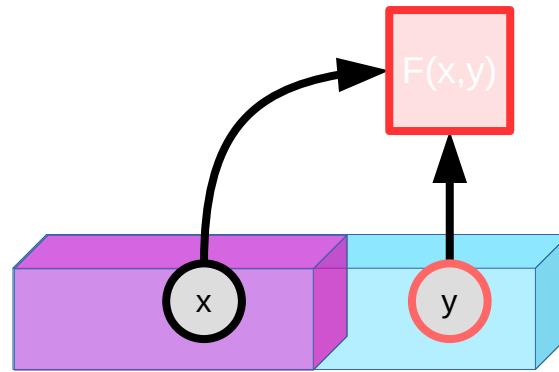

Energy-Based Models for Self-Supervised Learning

Capturing dependencies through an energy function

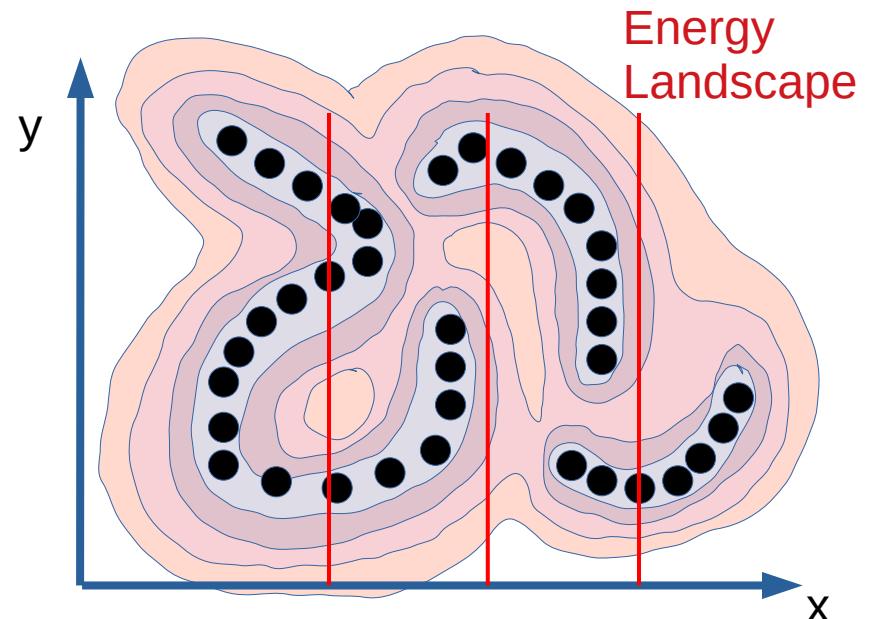

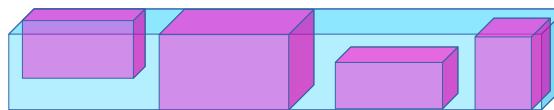

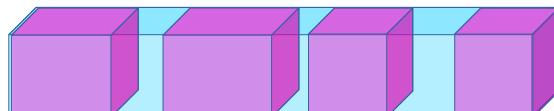

Probabilistic modeling is intractable in high-dimensional continuous domains.

Energy-Based Models: Implicit function

- ▶ The only way to formalize & understand all model types
- ▶ Gives low energy to compatible pairs of x and y
- ▶ Gives higher energy to incompatible pairs

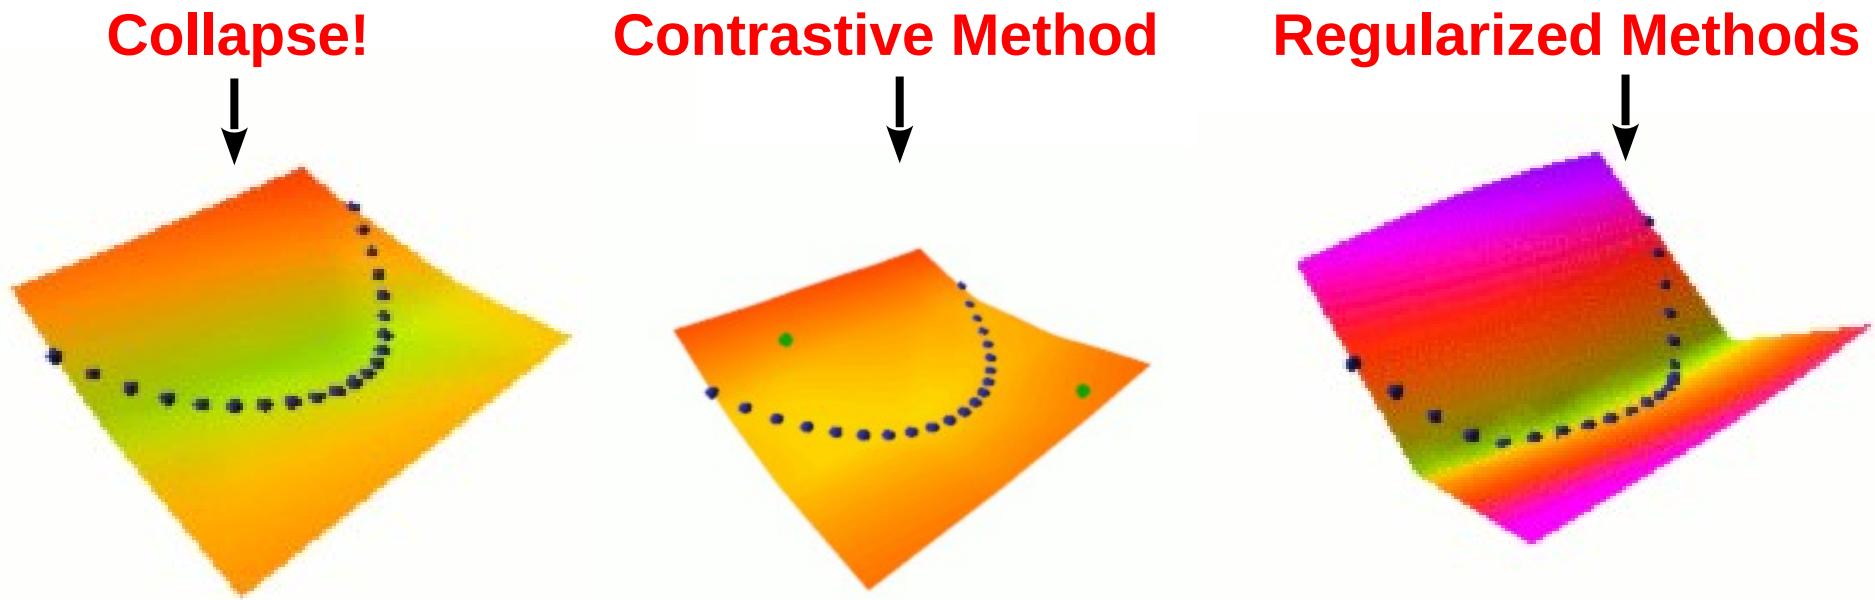

time or space →

$$\check{y} = \operatorname{argmin}_y F(x, y)$$

Training Energy-Based Models: Collapse Prevention

- ▶ A flexible energy surface can take any shape.
- ▶ We need a loss function that shapes the energy surface so that:
 - ▶ Data points have low energies
 - ▶ Points outside the regions of high data density have higher energies.

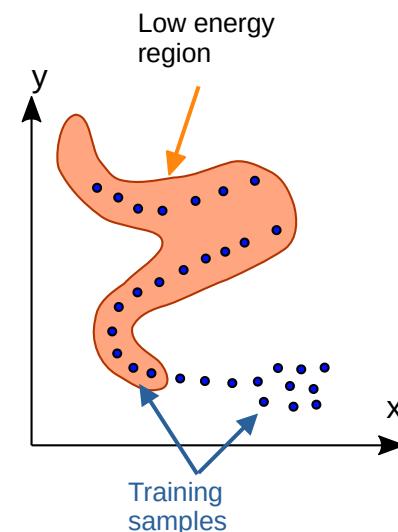

EBM Training: two categories of methods

► Contrastive methods

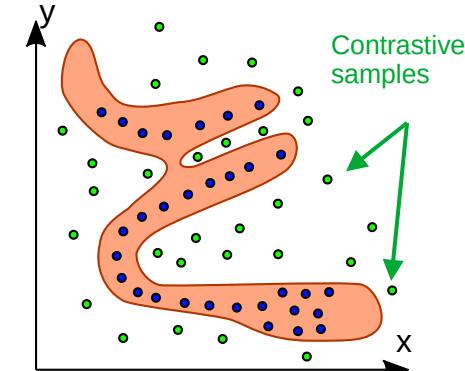

- ▶ Push down on energy of training samples
- ▶ Pull up on energy of suitably-generated contrastive samples
- ▶ Scales very badly with dimension

► Regularized Methods

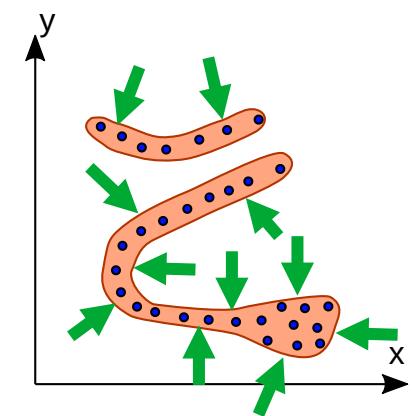

- ▶ Regularizer minimizes the volume of space that can take low energy

Contrastive Method

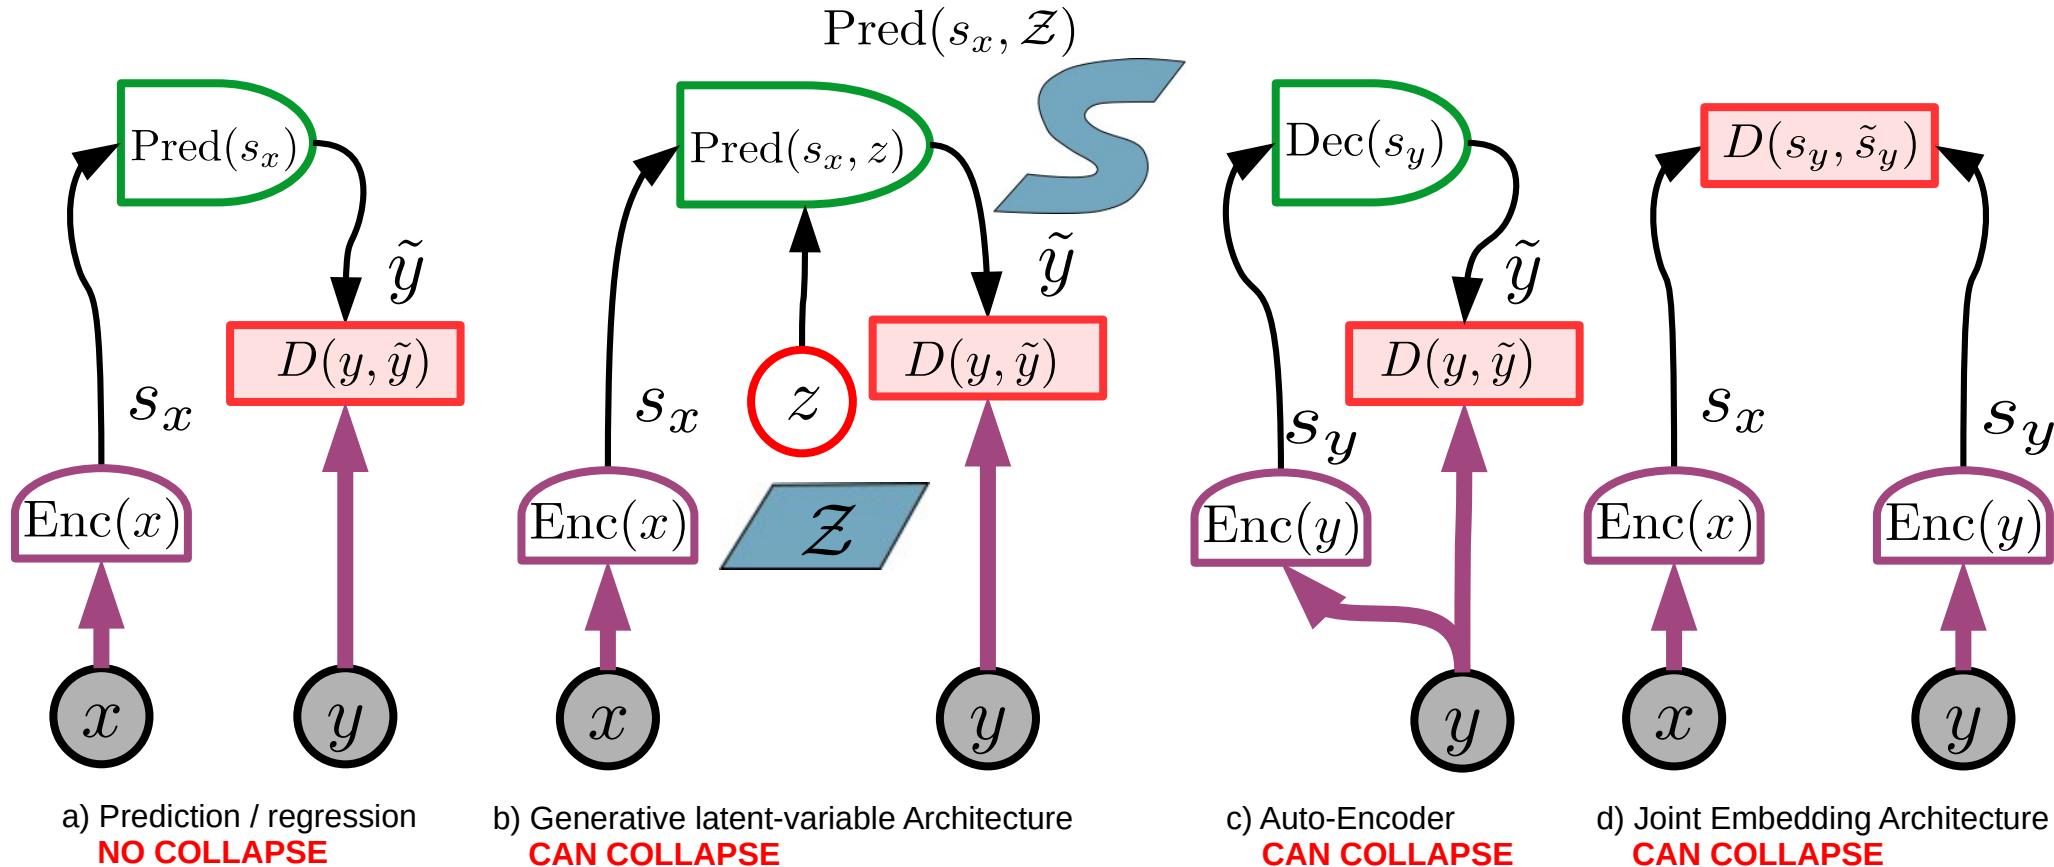

Regularized Method

EBM Architectures

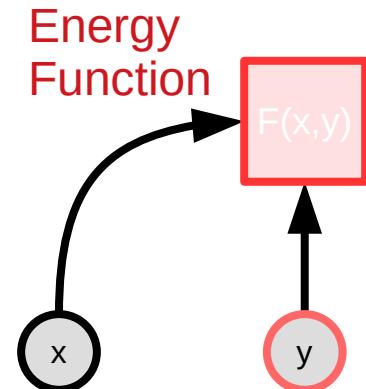

► Some architectures can lead to a collapse of the energy surface

Energy-Based Models vs Probabilistic Models

- ▶ Probabilistic models are a special case of EBM
- ▶ Energies are like un-normalized negative log probabilities
- ▶ Why use EBM instead of probabilistic models?
- ▶ EBM gives more flexibility in the choice of the scoring function.
- ▶ More flexibility in the choice of objective function for learning
- ▶ From energy to probability: **Gibbs-Boltzmann distribution**
- ▶ Beta is a positive constant

$$P(y|x) = \frac{e^{-\beta F(x,y)}}{\int_{y'} e^{-\beta F(x,y')}} \quad \text{Energy Function} \quad F(x,y)$$

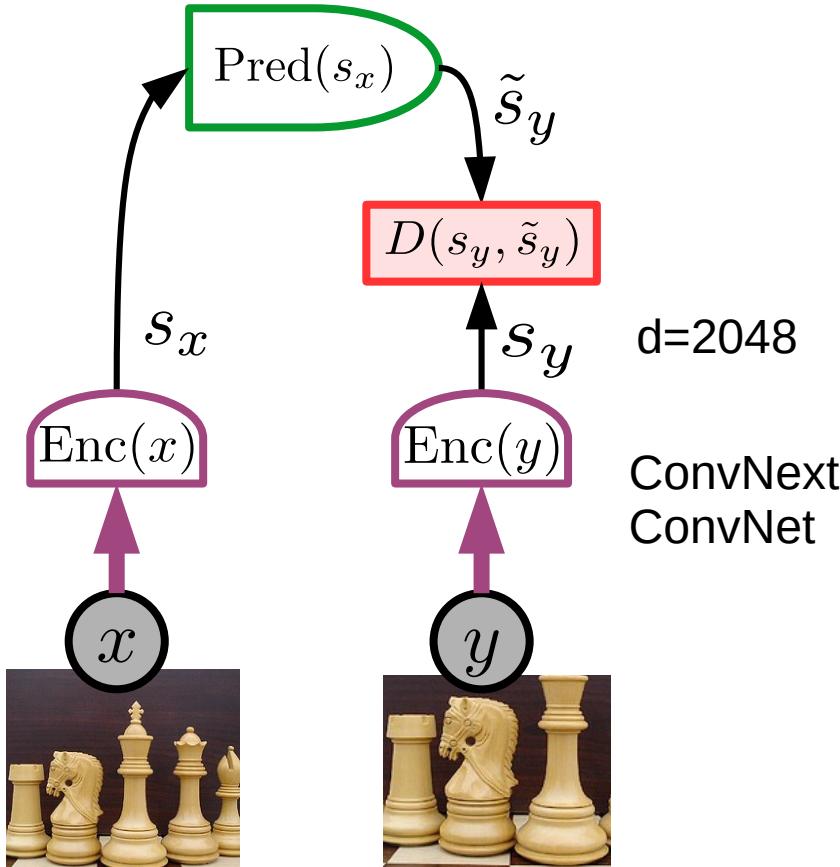

Contrastive Methods vs Regularized/Architectural Methods

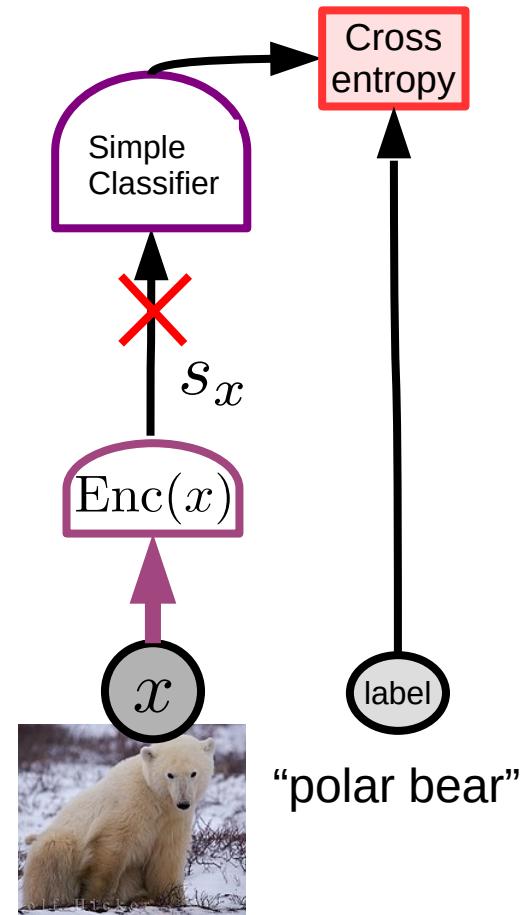

- ▶ **Contrastive:** [they all are different ways to pick which points to push up]
 - ▶ C1: push down of the energy of data points, push up everywhere else: **Max likelihood** (needs tractable partition function or variational approximation)
 - ▶ C2: **push down of the energy of data points, push up on chosen locations:** max likelihood with MC/MMC/HMC, Contrastive divergence, **Metric learning/Siamese nets**, Ratio Matching, Noise Contrastive Estimation, Min Probability Flow, **adversarial generator/GANs**
 - ▶ C3: train a function that maps points off the data manifold to points on the data manifold: denoising auto-encoder, **masked auto-encoder** (e.g. BERT)
- ▶ **Regularized/Architectural:** [Different ways to limit the information capacity of the latent representation]
 - ▶ A1: build the machine so that the volume of low energy space is bounded: PCA, K-means, Gaussian Mixture Model, Square ICA, normalizing flows...
 - ▶ A2: **use a regularization term that measures the volume of space that has low energy:** Sparse coding, **sparse auto-encoder**, LISTA, Variational Auto-Encoders, discretization/VQ/VQVAE.
 - ▶ A3: $F(x,y) = C(y, G(x,y))$, make $G(x,y)$ as "constant" as possible with respect to y : Contracting auto-encoder, saturating auto-encoder
 - ▶ A4: minimize the gradient and maximize the curvature around data points: score matching

SSL-Pretrained Joint Embedding for Image Recognition

JEPA/JEA pretrained with SSL

Training a supervised classification head

(Sample) Contrastive Joint Embedding

► Example:

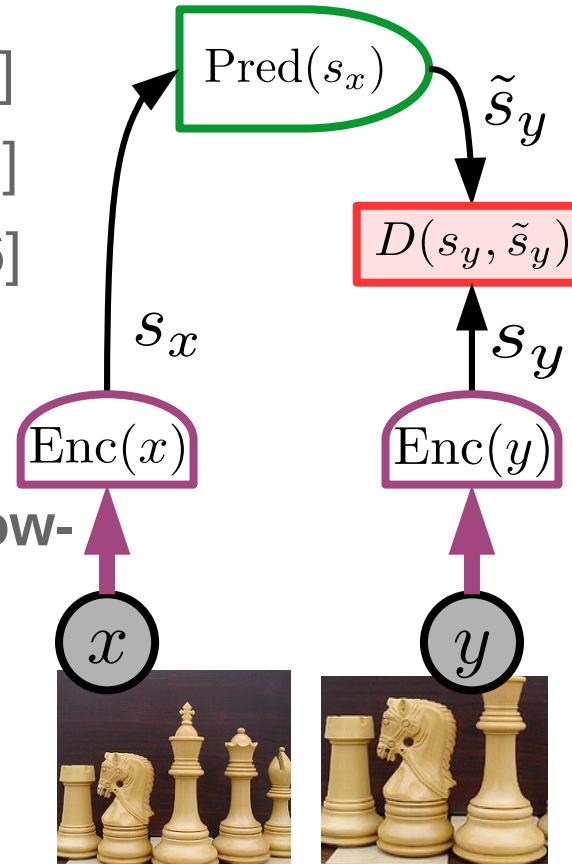

- Siamese Networks
[Bromley NIPS 1993]
[Chopra CVPR 2005]
[Hadsell CVPR 2006]

- SimCLR
[Chen 2020]

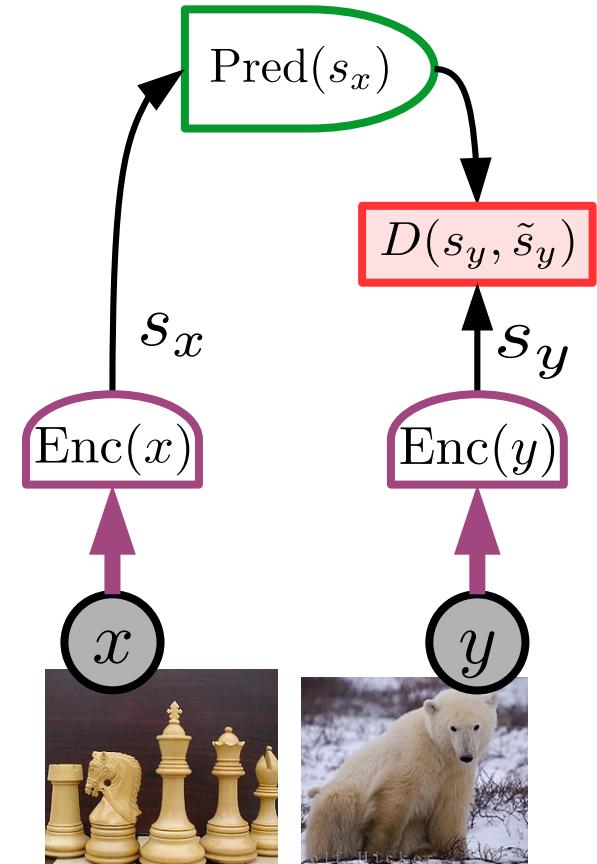

- Can only produce low-dimensional image representations

- Around 200 D.

Make $D(s_y, s_x)$ small

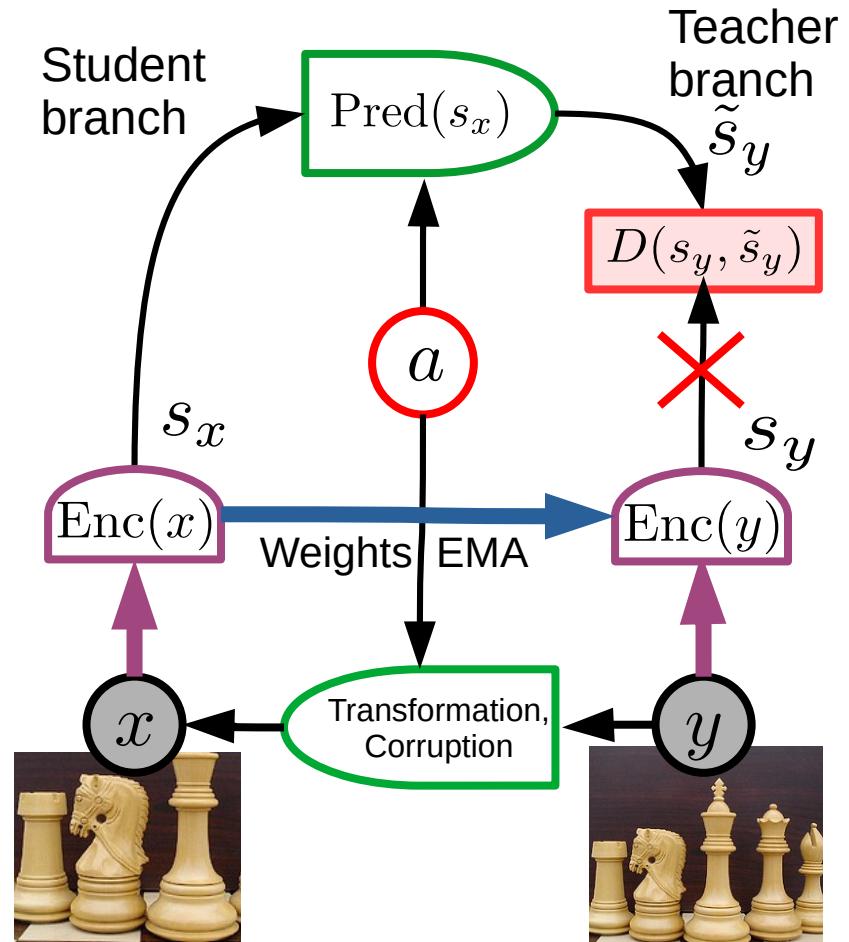

Make $D(s_y, s_x)$ large

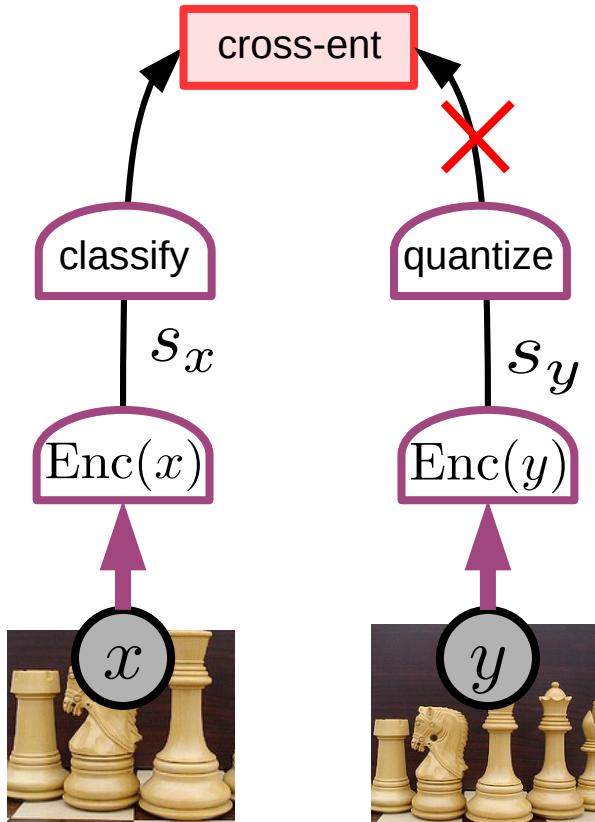

Distillation Methods

- ▶ Distillation-based SSL:
 - ▶ Bootstrap Your Own Latents [Grill arXiv:2006.07733]
 - ▶ SimSiam [Chen & He arXiv:2011.10566]
 - ▶ DINOv2 [Oquab arXiv:2304.07193]
 - ▶ I-JEPA [Assran 2023]
 - ▶ V-JEPA [Bardes 2024]
- ▶ Advantages
 - ▶ No negative samples, fast
- ▶ Disadvantage:
 - ▶ we don't completely understand why it works! [Tian et al. ArXiv:2102.06810]

DINOv2: Joint Embedding Architecture

DINO-style SSL scales & surpasses Supervised Methods

- ▶ “Scaling Language-Free Visual Representation Learning”
[Fan et al. ArXiv:2504.01017]
- ▶ Scales better with model size and training set size than CLIP-style SL

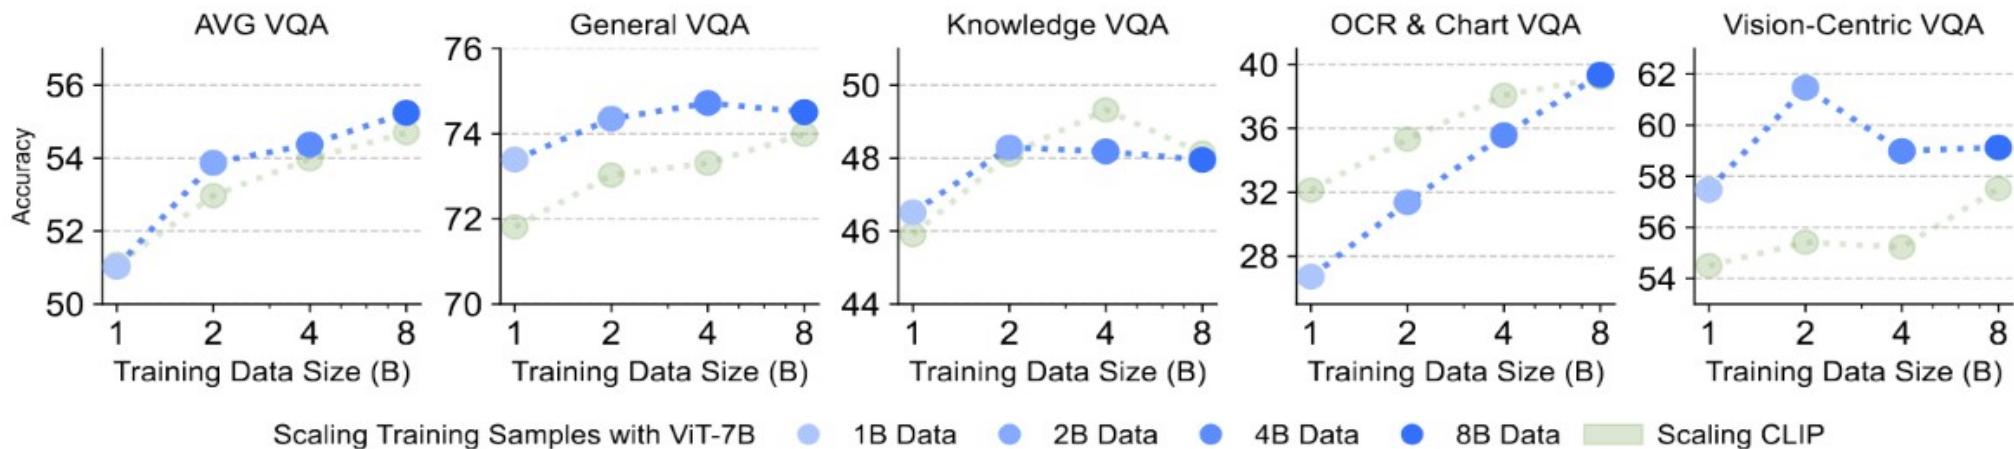

Figure 4 Scaling up examples seen when training Web-DINO-7B. Performance across different VQA categories as training data increases from 1B to 8B images. While General and Vision-Centric tasks show diminishing returns after 2B images, OCR & Chart tasks demonstrate continued improvement, contributing to steady gains in average performance. Further, Web-DINO consistently outperforms same-size (ViT-7B) CLIP models with different training samples seen. The x-axis plots training data size on a log-scale.

Canopy Height Map using DINOV2

- ▶ Estimates tree canopy height from satellite images using DINOV2 features
- ▶ Using ground truth from Lidar images
- ▶ 0.5 meter resolution images
- ▶ [ArXiv:2304.07213]
 - ▶ Tolan et al.: Sub-meter resolution canopy height maps using self-supervised learning and a vision transformer trained on Aerial and GEDI Lidar

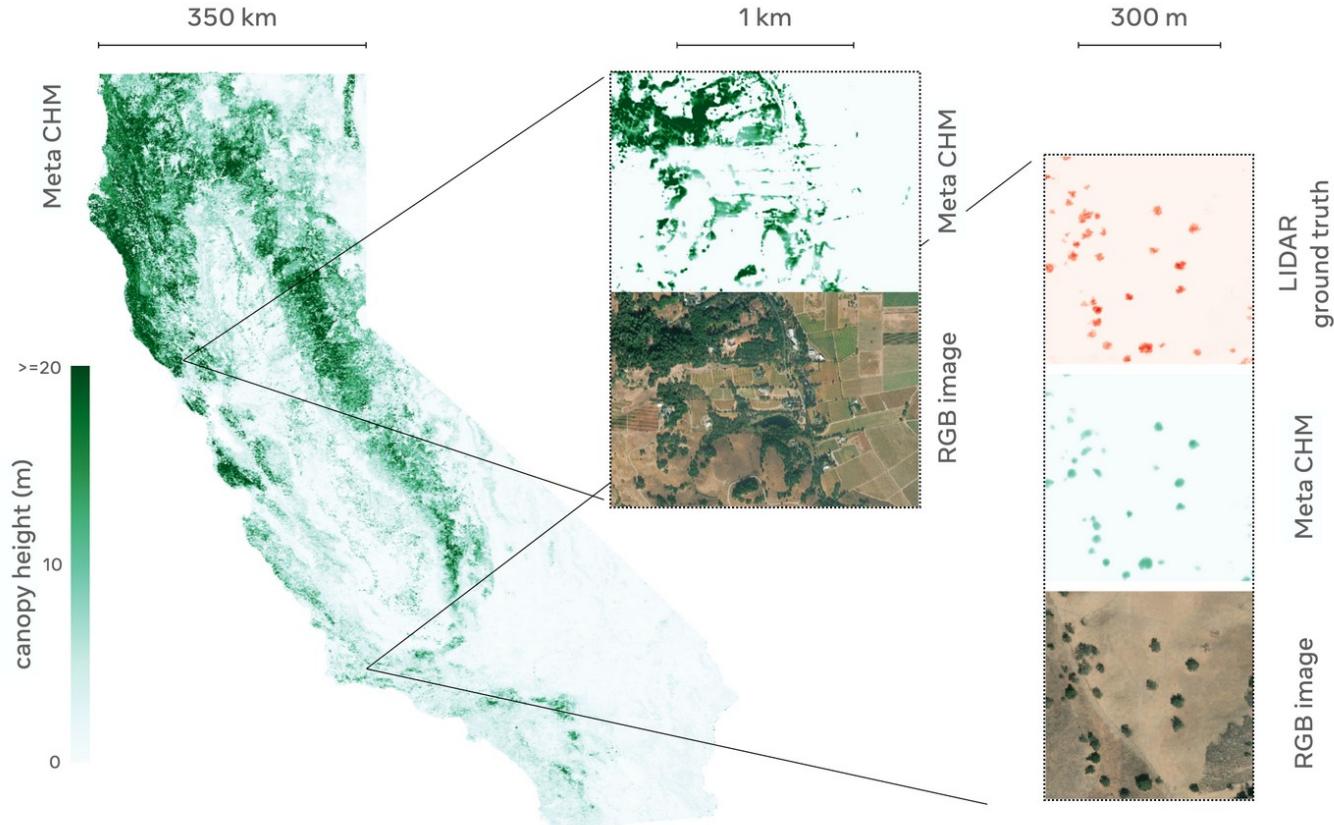

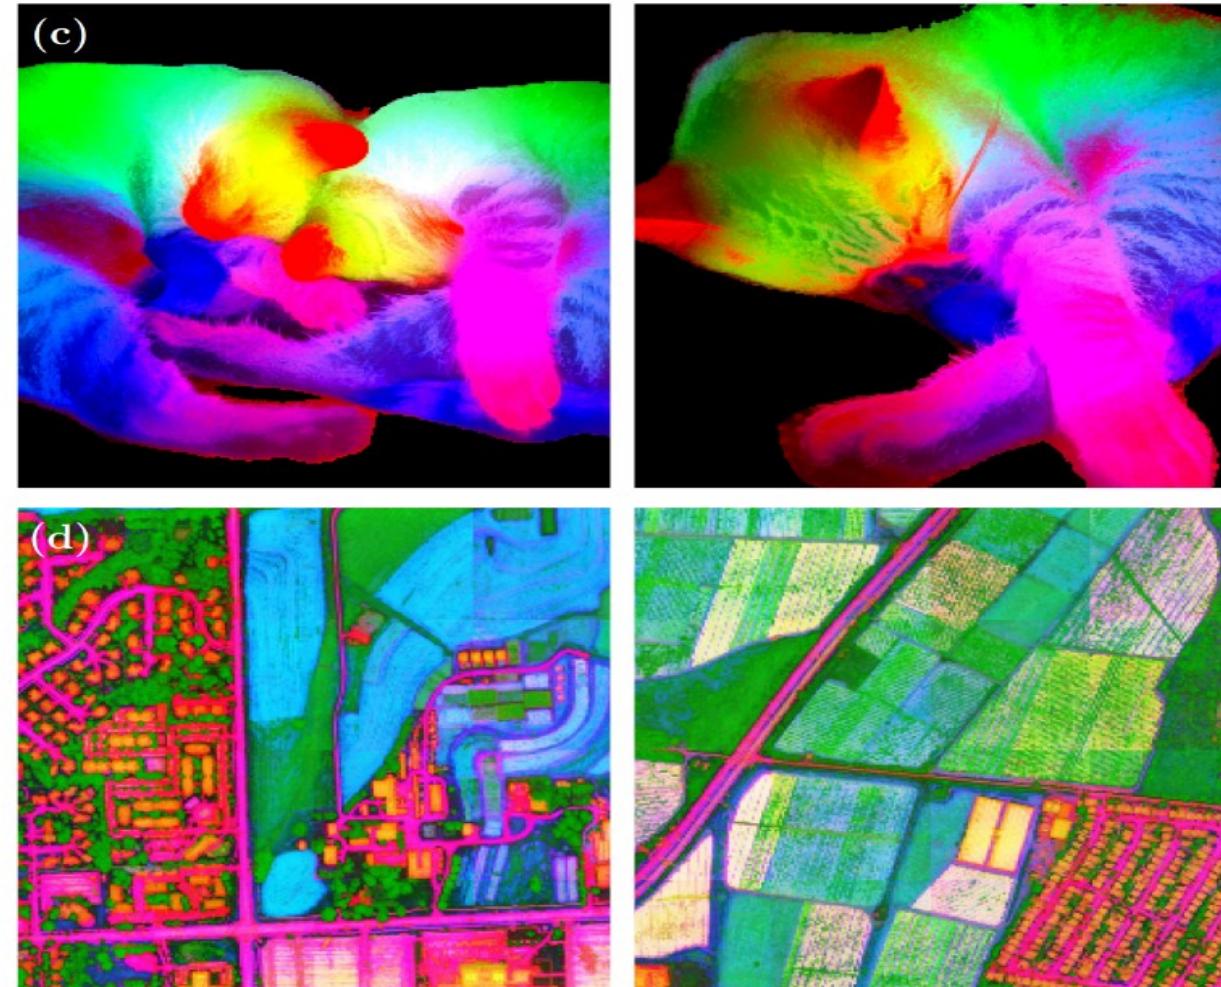

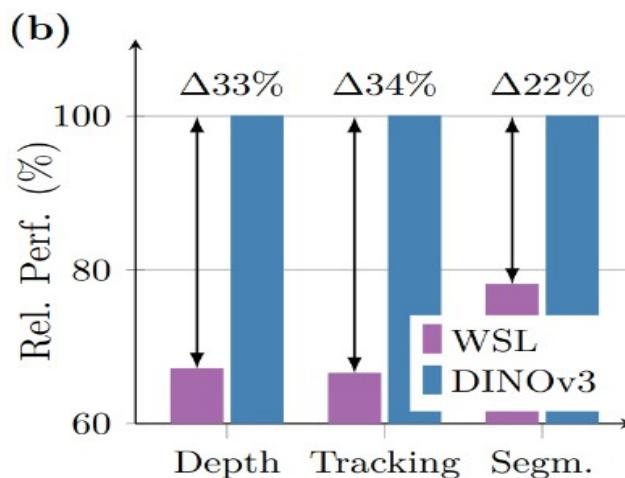

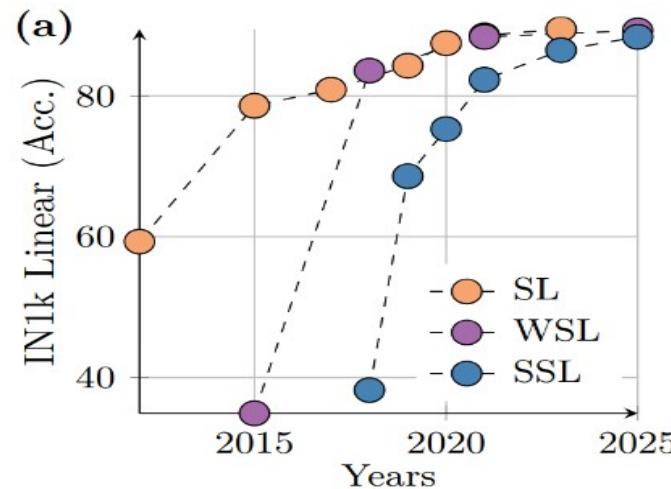

Figure 1: Canopy Height Map (CHM) for California, with inset showing zoomed-in region with input RGB imagery and LIDAR ground truth

V-JEPA 2 training

V-JEPA-2 planning

Training the Action-Conditioned Predictor

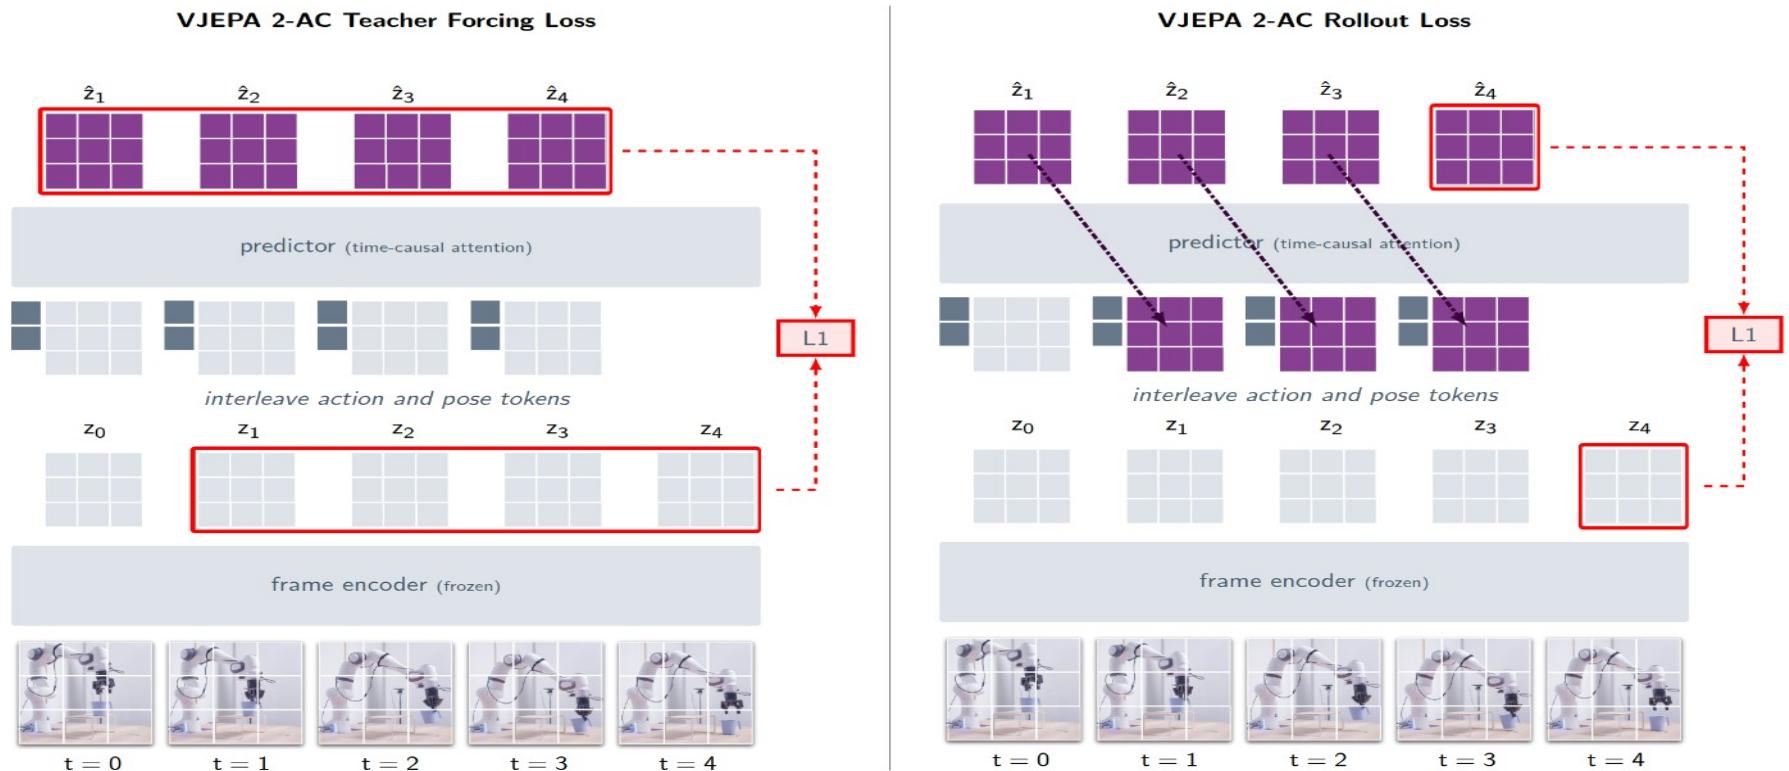

Figure 6 V-JEPA 2-AC training. V-JEPA 2-AC is trained in an autoregressive fashion, utilizing a teacher forcing loss and a rollout loss. **(Left)** In the teacher forcing loss, the predictor takes the encoding of the current frame representation as input and learns to predict the representation of the next timestep. **(Right)** The rollout loss involves feeding the predictor's output back as input, allowing the model to be trained to predict several timesteps ahead. By optimizing the sum of these two losses, V-JEPA 2-AC enhances its ability to accurately forecast the future by reducing error accumulation during rollouts.

V-JEPA 2 Results

| Task Type | Benchmark | V-JEPA 2 | Previous Best |
|---------------------------------------------|----------------------------------------------------------|----------|-----------------------------------------|
| Planning and Robot Control from Image Goals | Reach | 100% | 100% (Octo) |

MMCR [Yerxa et al. NeurIPS 2023]

Training a JEPA with Information Maximization

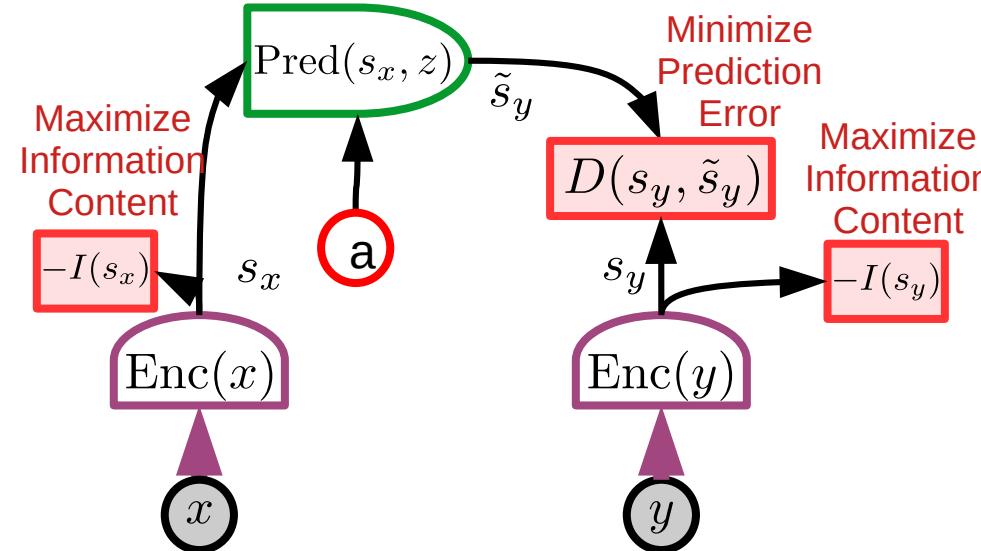

- ▶ Three terms in the cost
 - ▶ Maximize information content in representation of x and y
 - ▶ Minimize Prediction error
 - ▶ Whitening S_x and S_y

MCR2 [Yu et al. NeurIPS 2020],
 Barlow Twins [Zbontar et al.
 ArXiv:2103.03230],
 VICReg [Bardes, Ponce, LeCun
 arXiv:2105.04906, ICLR 2022],
 W-MSE [Ermolov et al. PMLR 2021],
 MMCR [Yerxa et al. NeurIPS 2023]

Training a JEPA with Information Maximization

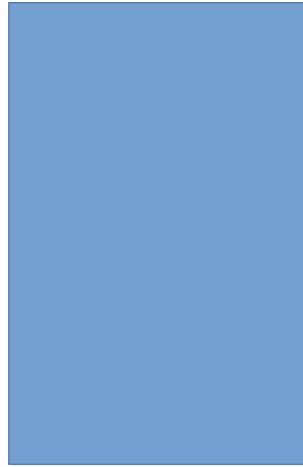

- ▶ **Main Challenge:**
- ▶ How can we maximize information content in representation of x and y ?
- ▶ We do not have lower bounds on information content !!!
- ▶ We only have upper bounds
- ▶ Because we must make assumptions about the type of dependencies that exist between the variables
- ▶ There may be complicated but unknown dependencies that lower the information content.

- ▶ **Basic idea: make the representations fill the space**
- ▶ Sample Contrastive: push vectors away from each other
- ▶ Dim Contrastive: push variables away from each other

Matrix of representations for a Batch of Samples

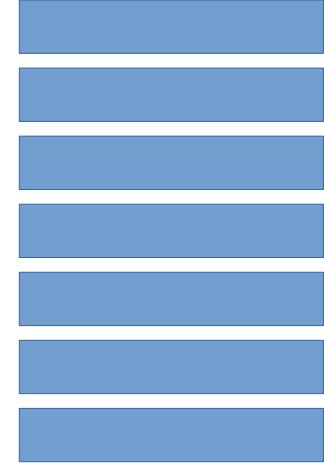

variables

samples

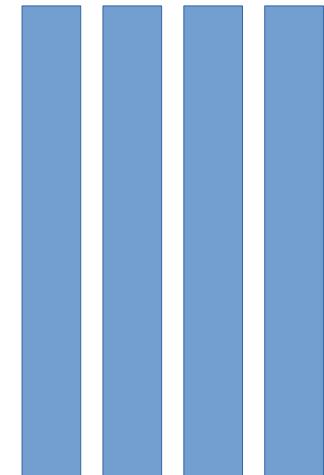

► Sample Contrastive Methods:

- Make the row of the matrix as different from each other as possible
- Requires a large number of rows
- Don't work in high dimension

► Dimension Contrastive Methods

- Make the column as different from each other as possible
- Requires a small number of rows
- Don't work for large batches

► Equivalence

[Garrido ICLR 2023,
ArXiv:2206.02574]

On the duality between
contrastive and non-
contrastive self-
supervised learning

Sample contrastive vs Dimension contrastive?

- ▶ [Garrido et al. Arxiv:2206.02574]
- ▶ “ON THE DUALITY BETWEEN CONTRASTIVE AND NON CONTRASTIVE SELF-SUPERVISED LEARNING”

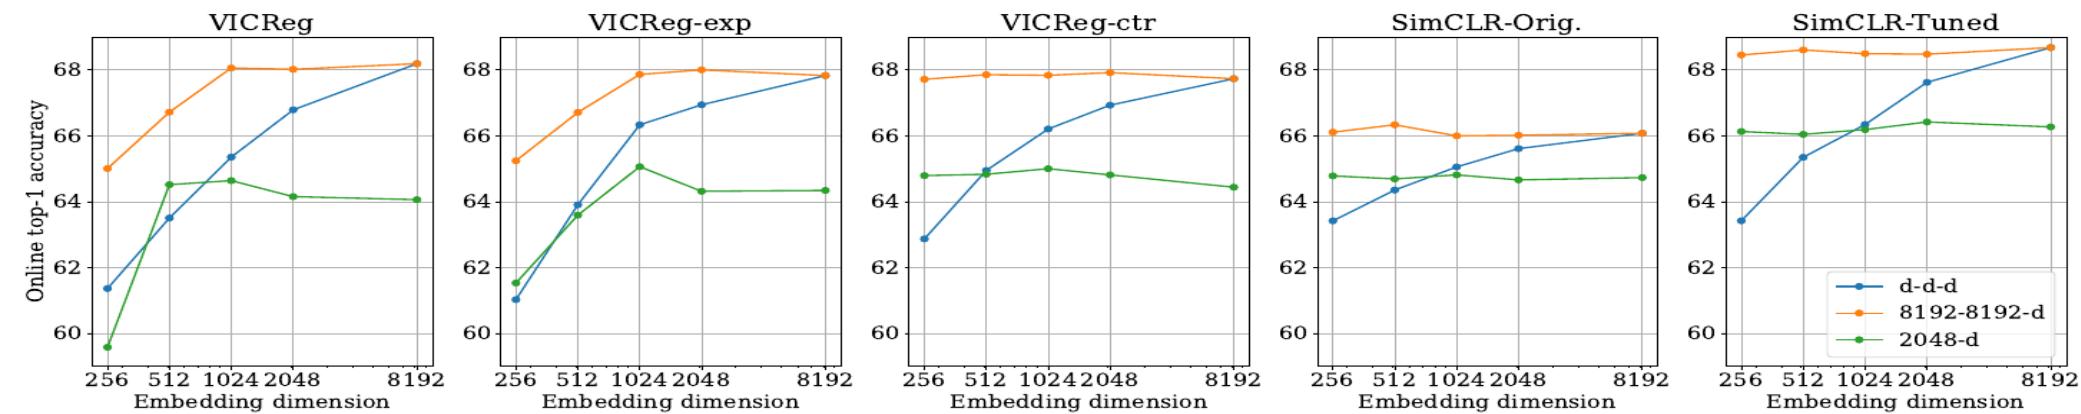

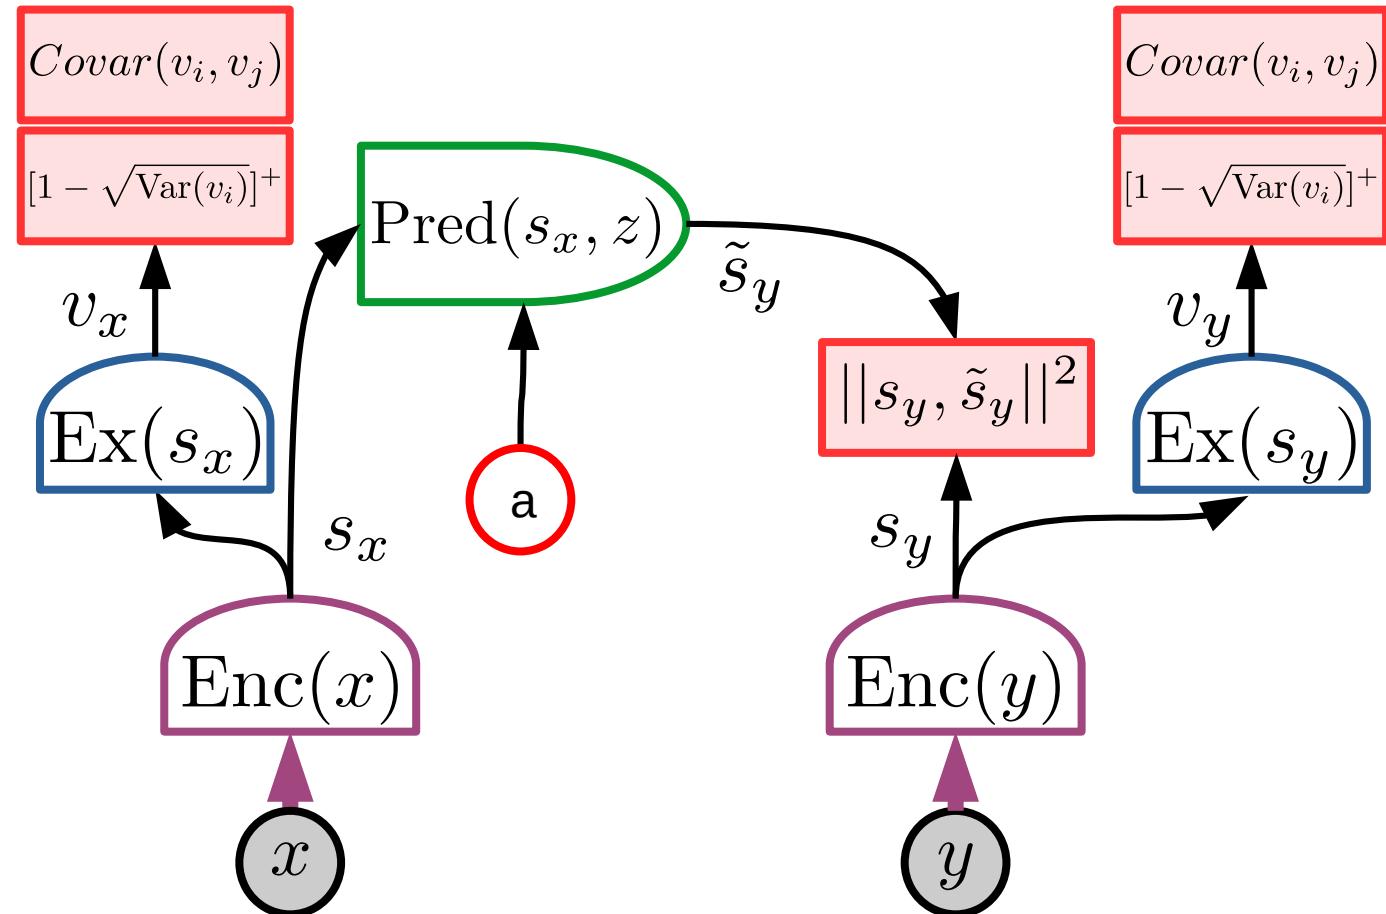

Figure 1: VICReg, VICReg-exp and VICReg-ctr perform similarly in 100 epochs training, validating empirically our theoretical result. While the original implementation of SimCLR performs significantly worse – which is unexpected per our theory – we are able to improve its performance to VICReg’s level. This further validates our findings. While different projector architectures impact performance, behaviours are similar across methods. Confer supplementary section H for numerical values and hyperparameters.

VICReg: Variance, Invariance, Covariance Regularization

- ▶ **Variance:**
 - ▶ Maintains variance of components of representations

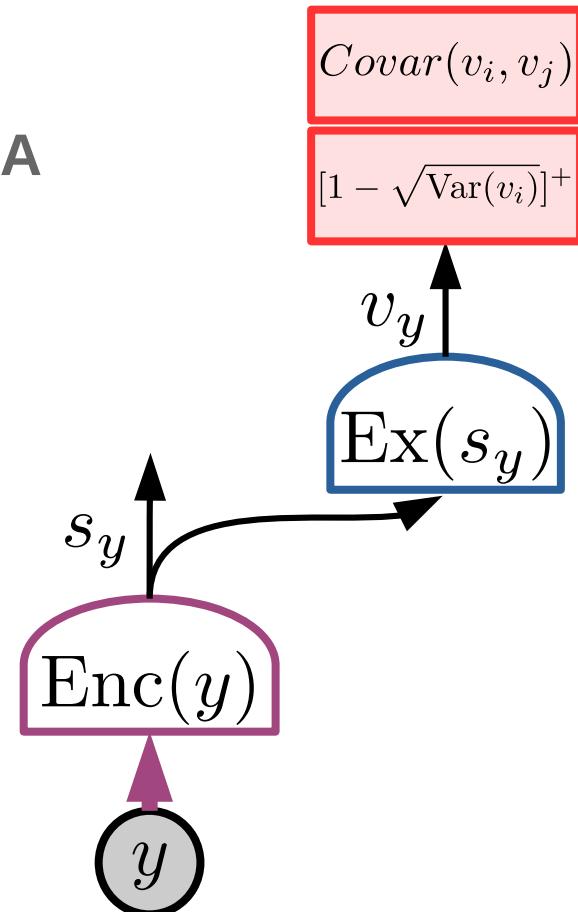

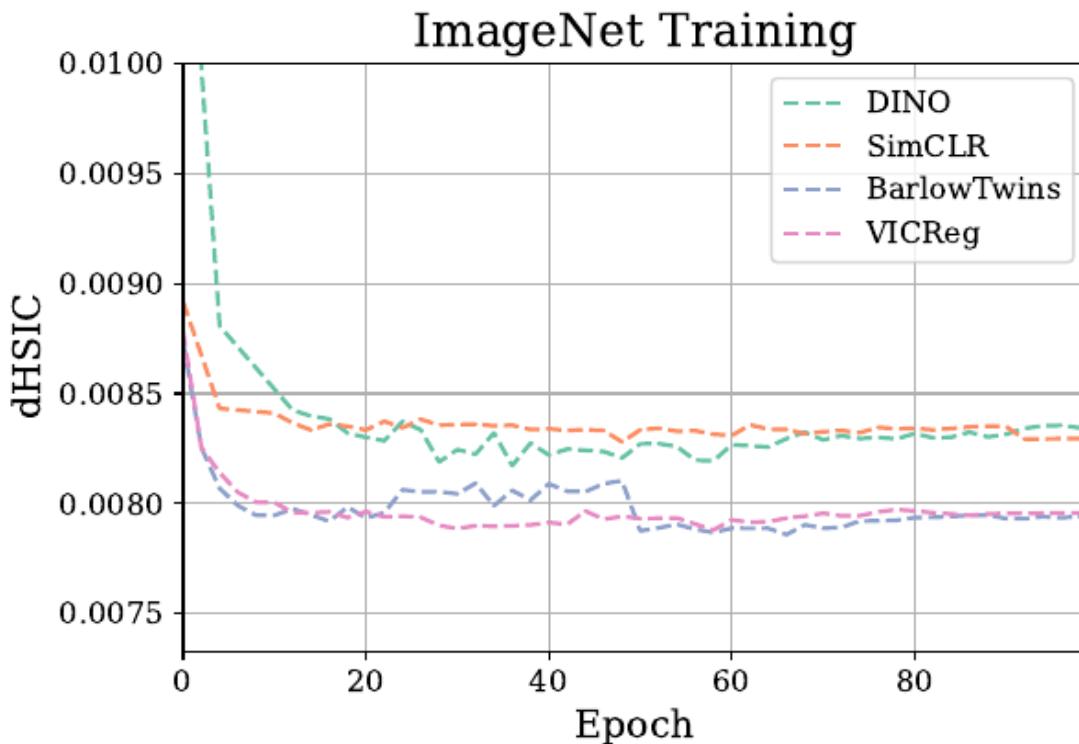

- ▶ **Covariance:**
 - ▶ Decorrelates components of covariance matrix of representations

- ▶ **Invariance:**
 - ▶ Minimizes prediction error.

VICReg: expander makes variables pairwise independent

- ▶ [Mialon, Balestriero, LeCun arxiv:2209.14905]
- ▶ VC criterion can be used for source separation / ICA

SSL for PDE: extracting dynamical parameters with VICReg

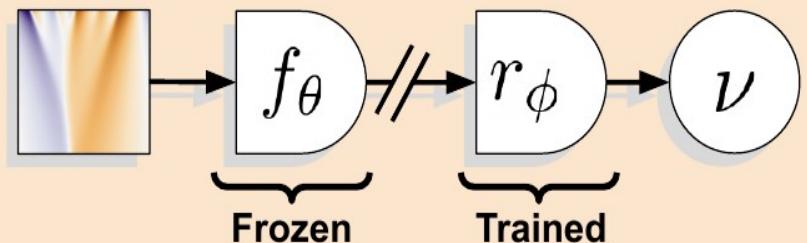

Using VICReg to learn representations of the equation.

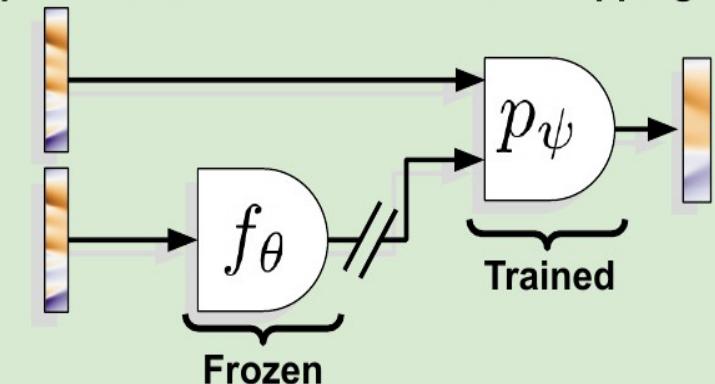

Self-supervised pretraining

Supervised downstream task

Representation conditioned time-stepping

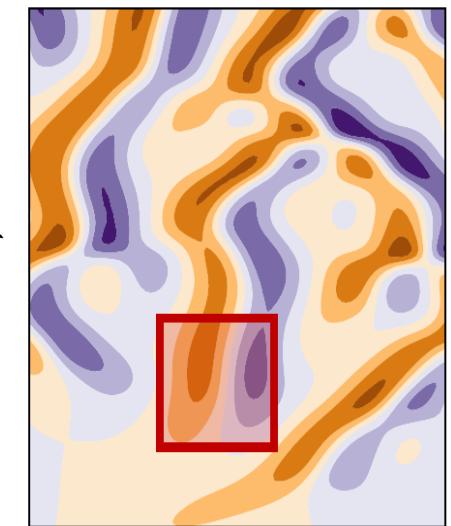

SSL for PDE

An example: the **Kuramoto-Sivashinsky (KS)** equation is a model of chaotic flow given by

$$u_t + uu_x + u_{xx} + u_{xxxx} = 0,$$

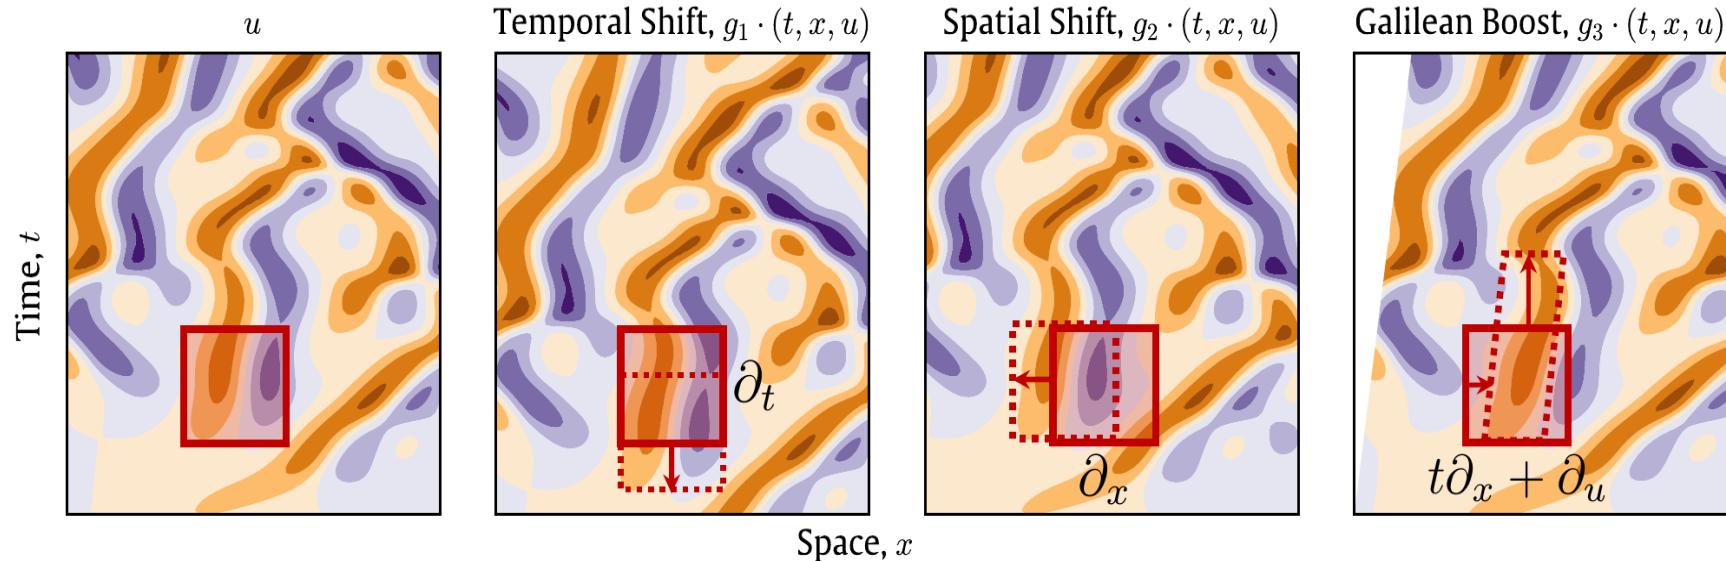

where $u(x, t)$ is the dependent variable.

- Often shows up in reaction-diffusion systems or flame propagation problems.
- Solution can be seen as an image...
- Admit Lie point symmetries: smooth transformations of a solution producing another solution to the same PDE.
- Can be used to learn models [Brandstetter et al., 2022].

A 1D solution to KS (x-axis is space).

SSL for PDE: Data “augmentation”

One parameter Lie point symmetries for the Kuramoto-Sivashinsky (KS) PDE. Left to right: un-modified solution (u), temporal shifts (g_1), spatial shifts (g_2), and Galilean boosts (g_3) with corresponding infinitesimal transformations in the Lie algebra placed inside the figure. The shaded red square denotes the original (x, t) , while the dotted line represents the same points after the augmentation is applied.

$$\text{Temporal Shift: } g_1(\epsilon) : (x, t, u) \mapsto (x, t + \epsilon, u)$$

$$\text{Spatial Shift: } g_2(\epsilon) : (x, t, u) \mapsto (x + \epsilon, t, u)$$

$$\text{Galilean Boost: } g_3(\epsilon) : (x, t, u) \mapsto (x + \epsilon t, t, u + \epsilon)$$

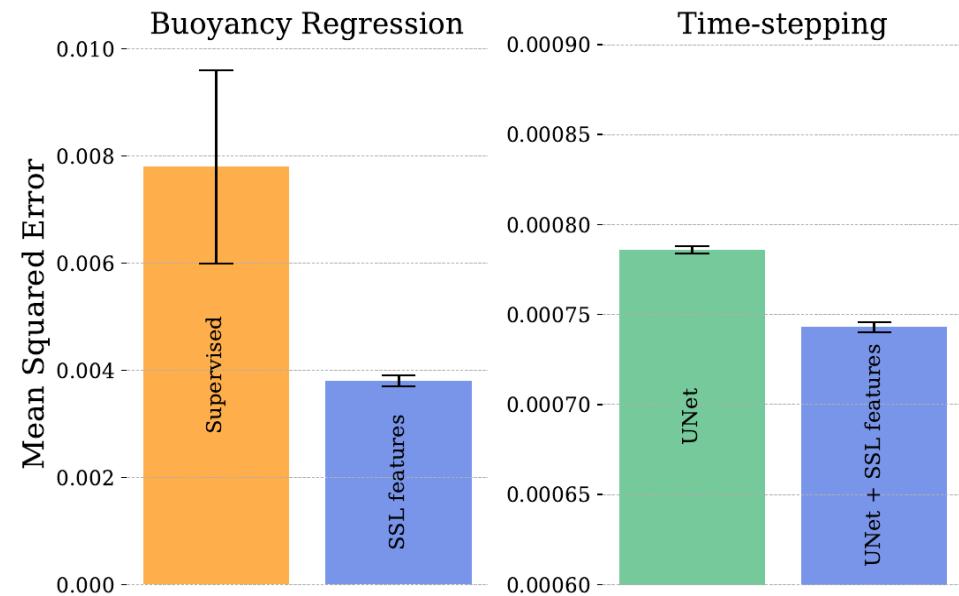

SSL for Predicting Buoyancy in Navier-Stokes

The **incompressible Navier-Stokes** equation is given by

$$\mathbf{u}_t = -\mathbf{u} \cdot \nabla \mathbf{u} - \frac{1}{\rho} \nabla p + \nu \nabla^2 \mathbf{u} + \mathbf{f}, \quad \nabla \cdot \mathbf{u} = 0.$$

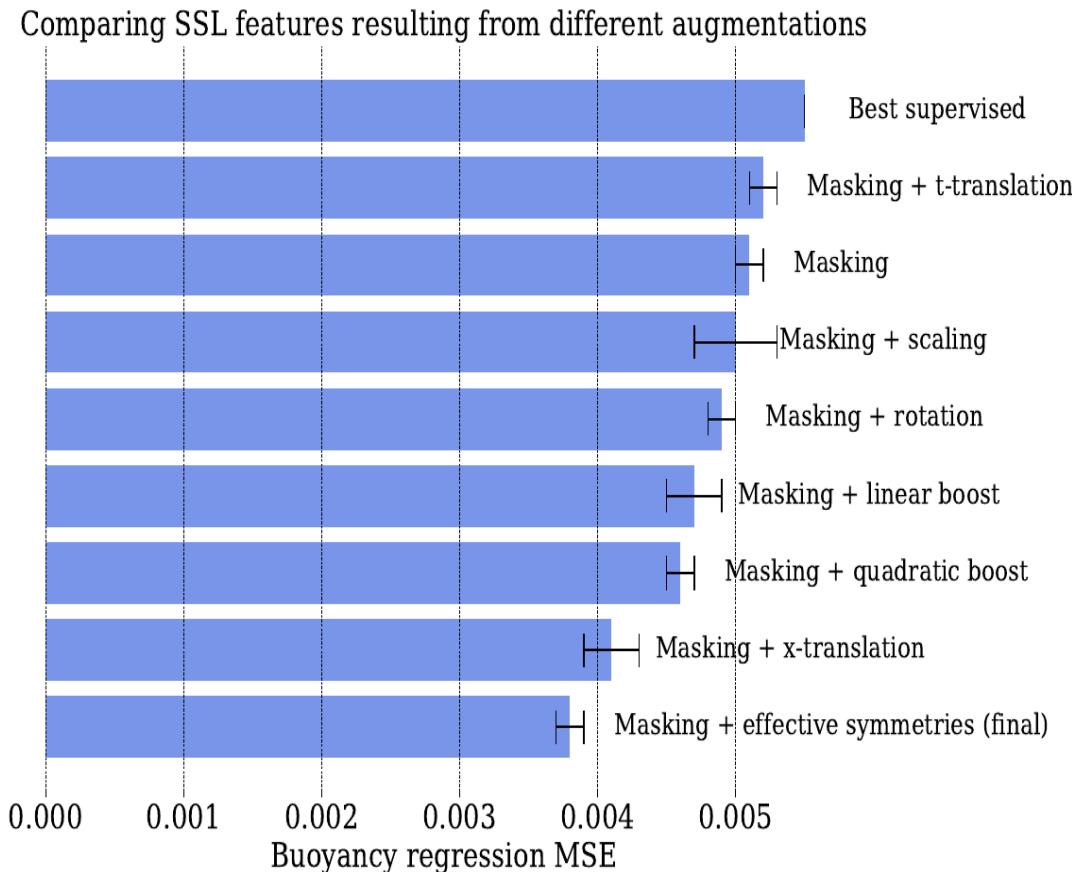

Downstream tasks for Navier-Stokes

- 26k 2D trajectories, 56 frames (128x128) each [Gupta and Brandstetter, 2023].
- Task 1: regressing buoyancy \mathbf{f} .
- Task 2: Time-stepping, predict next frames given past frames.
- SSL features are effective and easy to use.

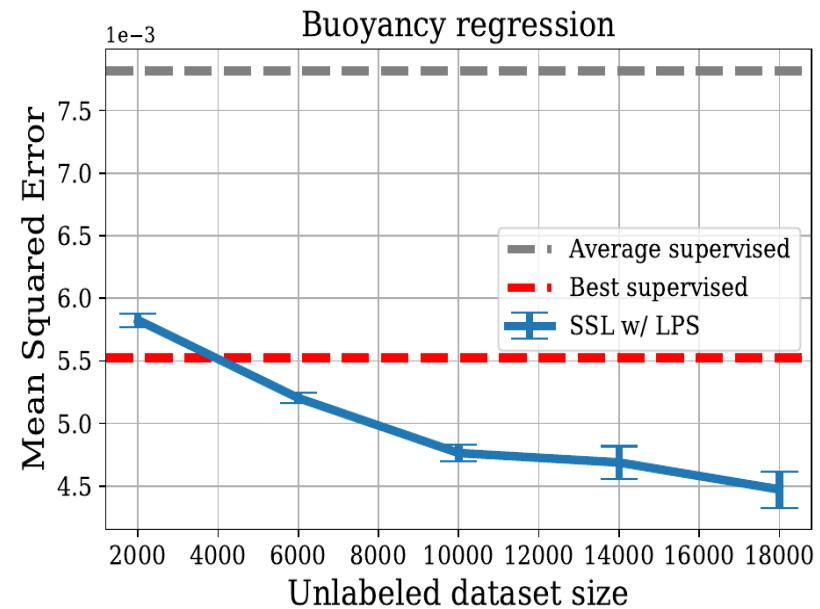

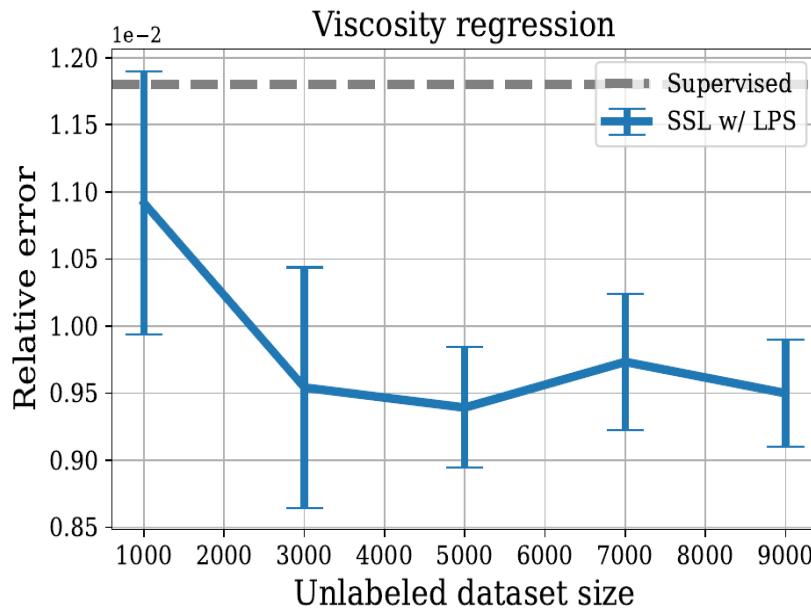

SSL for Predicting Buoyancy in Navier-Stokes

- Navier-Stokes: 8 Lie symmetry groups, with varying strength.
- Intuition is not sufficient to select augmentations.
- Optimal mix is different from supervised [Brandstetter et al., 2022].
- Masking is necessary but not really sufficient.

SSL pre-training gives better results than purely supervised

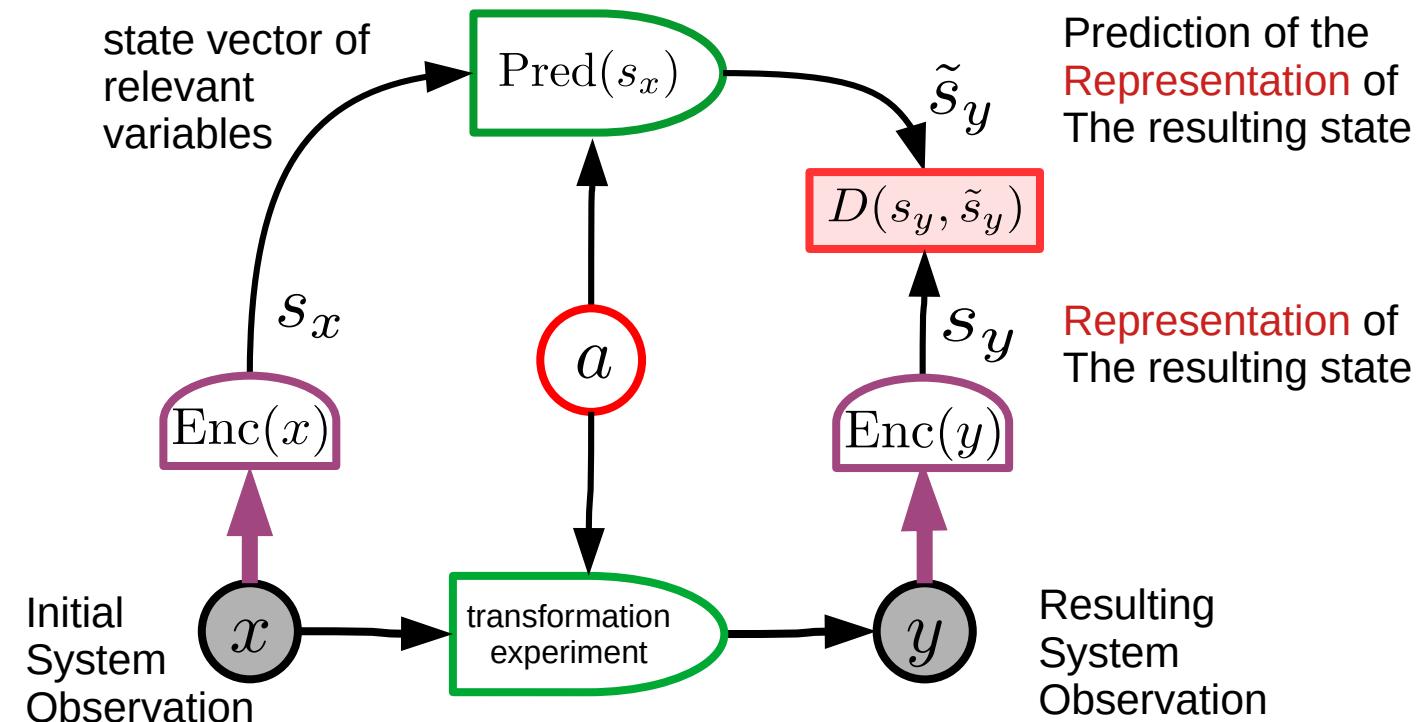

SSL vs. supervised: open question in vision [Sariyildiz et al., 2023, Oquab et al., 2023]. Here, big discrepancy.

Influence of dataset size on regression tasks. **(Left)** Kinematic regression on Burger's equation. **(Right)** Buoyancy regression on Navier-Stokes' equation.

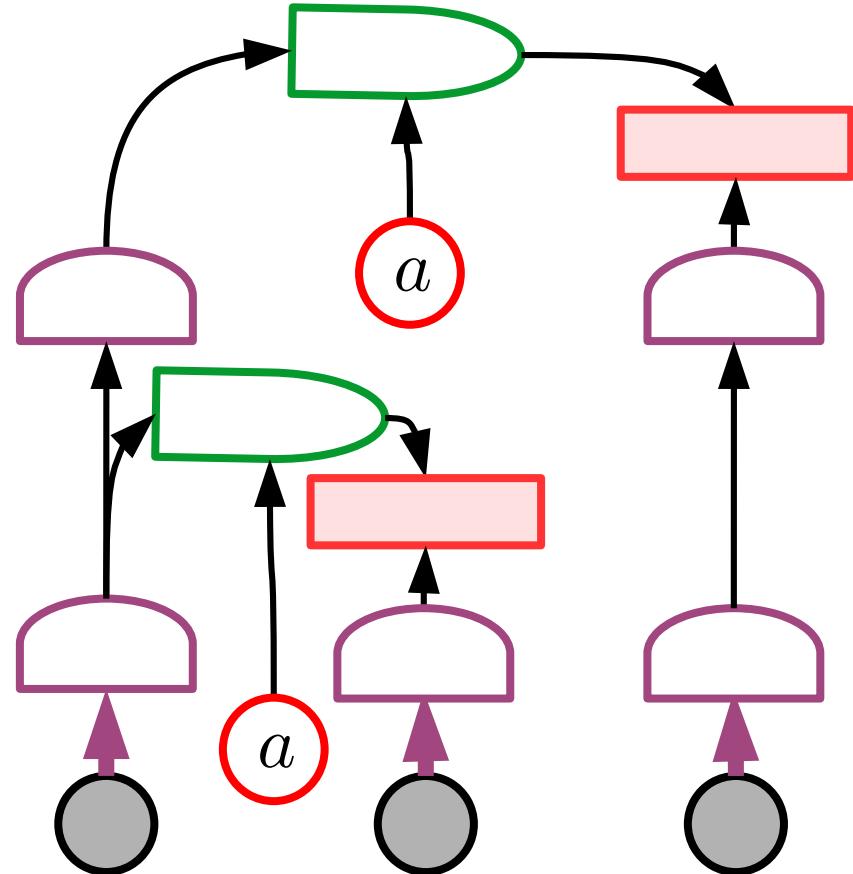

Science is all about finding abstract representation spaces

- ▶ Find an **abstract state representation** that allows to make predictions
- ▶ Extract the state representation from observation/measurement
- ▶ Predict outcome resulting from an intervention/experiment
- ▶ Irrelevant and unpredictable information is eliminated from the representation
- ▶ The representation contains information that makes prediction possible

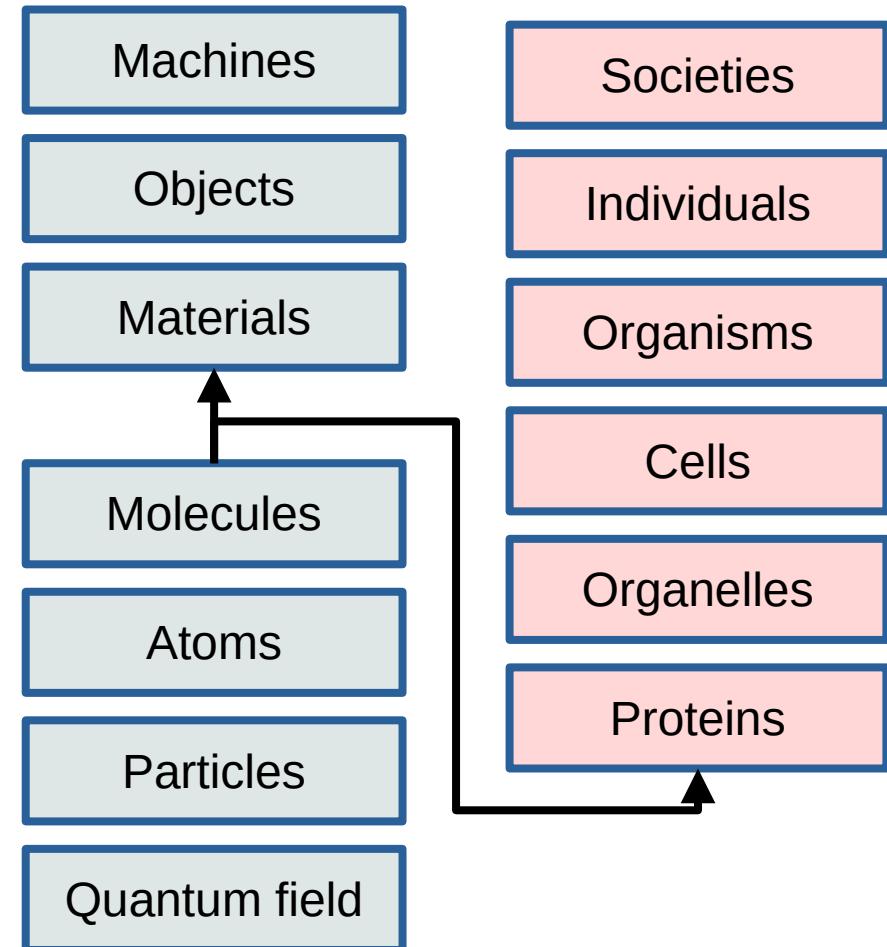

Multi-level hierarchy of models and representations

- ▶ Lower levels make short-range (short-term) predictions.
 - ▶ Preserve details.
 - ▶ Are inaccurate or computationally difficult for long-range predictions
- ▶ Higher levels make longer-range (longer-term) predictions.
 - ▶ Representations contain less details
 - ▶ Can make accurate long-term predictions, but with fewer details.

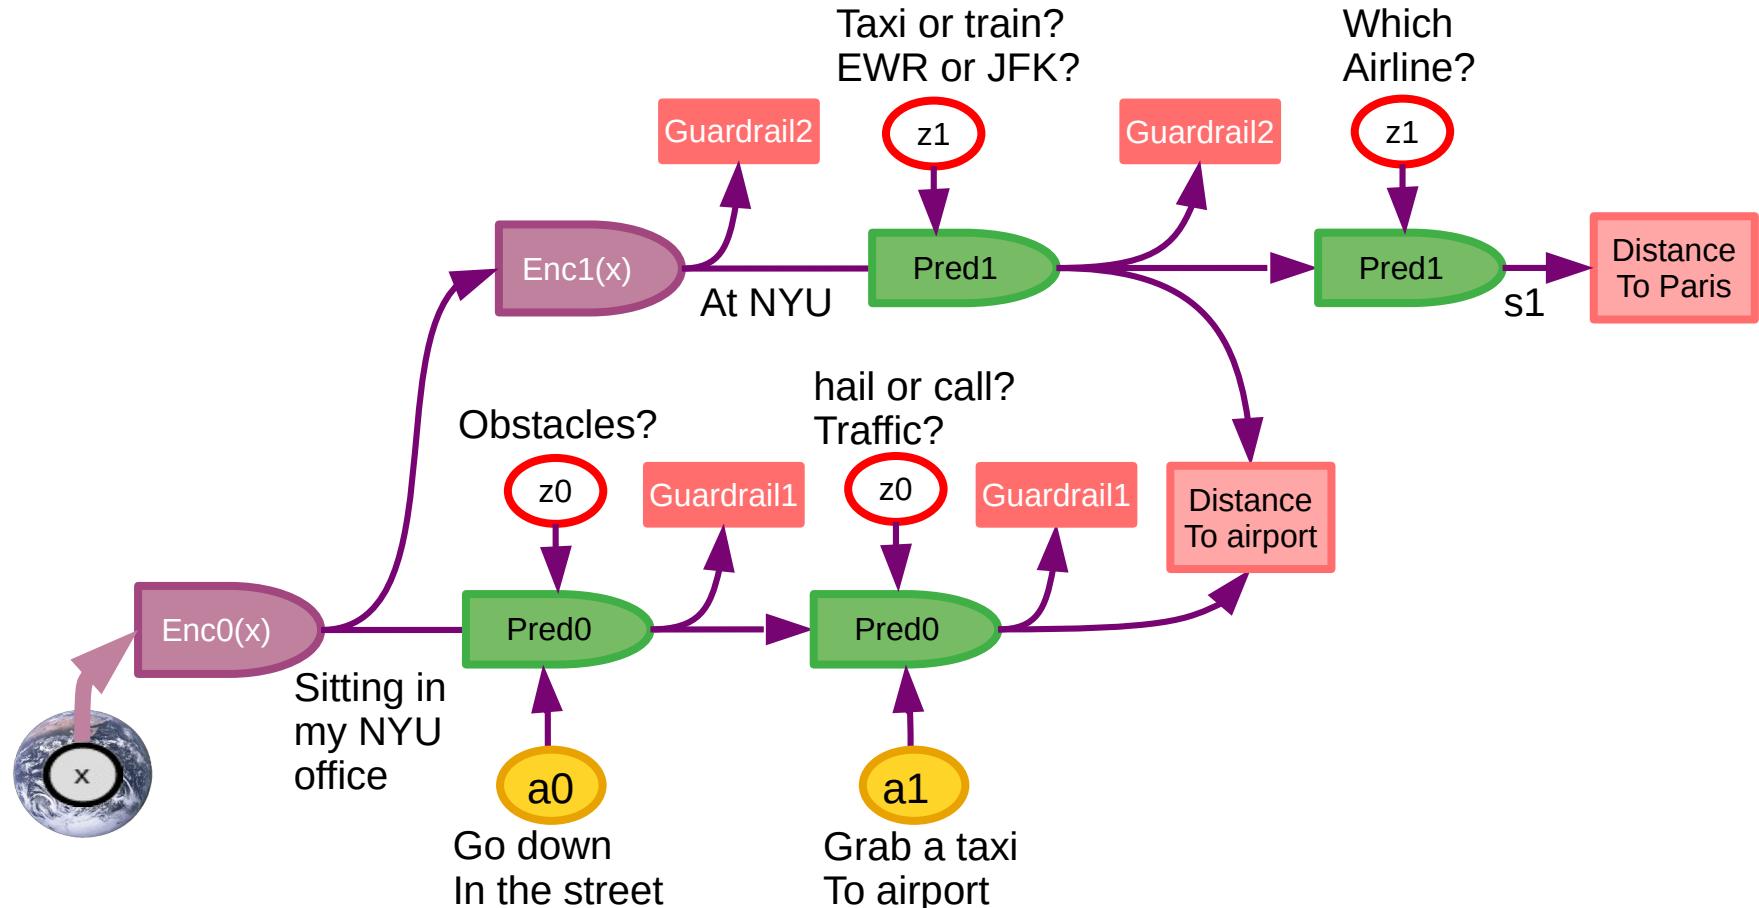

Multi-level hierarchy of models and representations

- ▶ Lower levels make short-range (short-term) predictions.
 - ▶ Preserve details.
 - ▶ Are inaccurate or computationally difficult for long-range predictions
- ▶ Higher levels make longer-range (longer-term) predictions.
 - ▶ Representations contain less details
 - ▶ Can make accurate long-term predictions, but with fewer details.

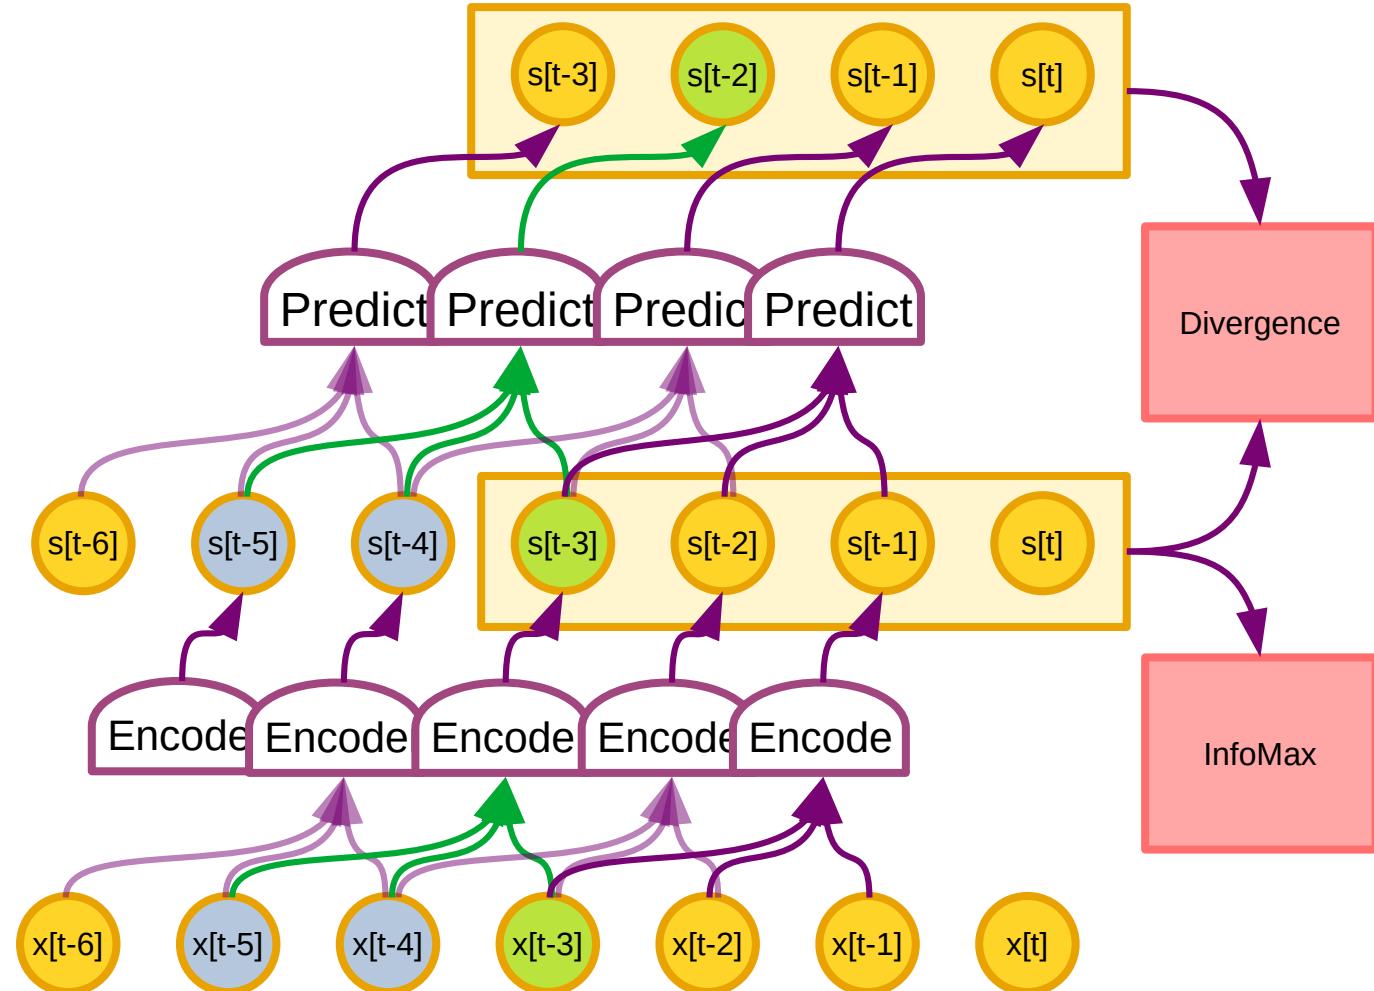

Ultimately, we want Hierarchical World Models

► Hierarchical Planning: going from NYU to Paris

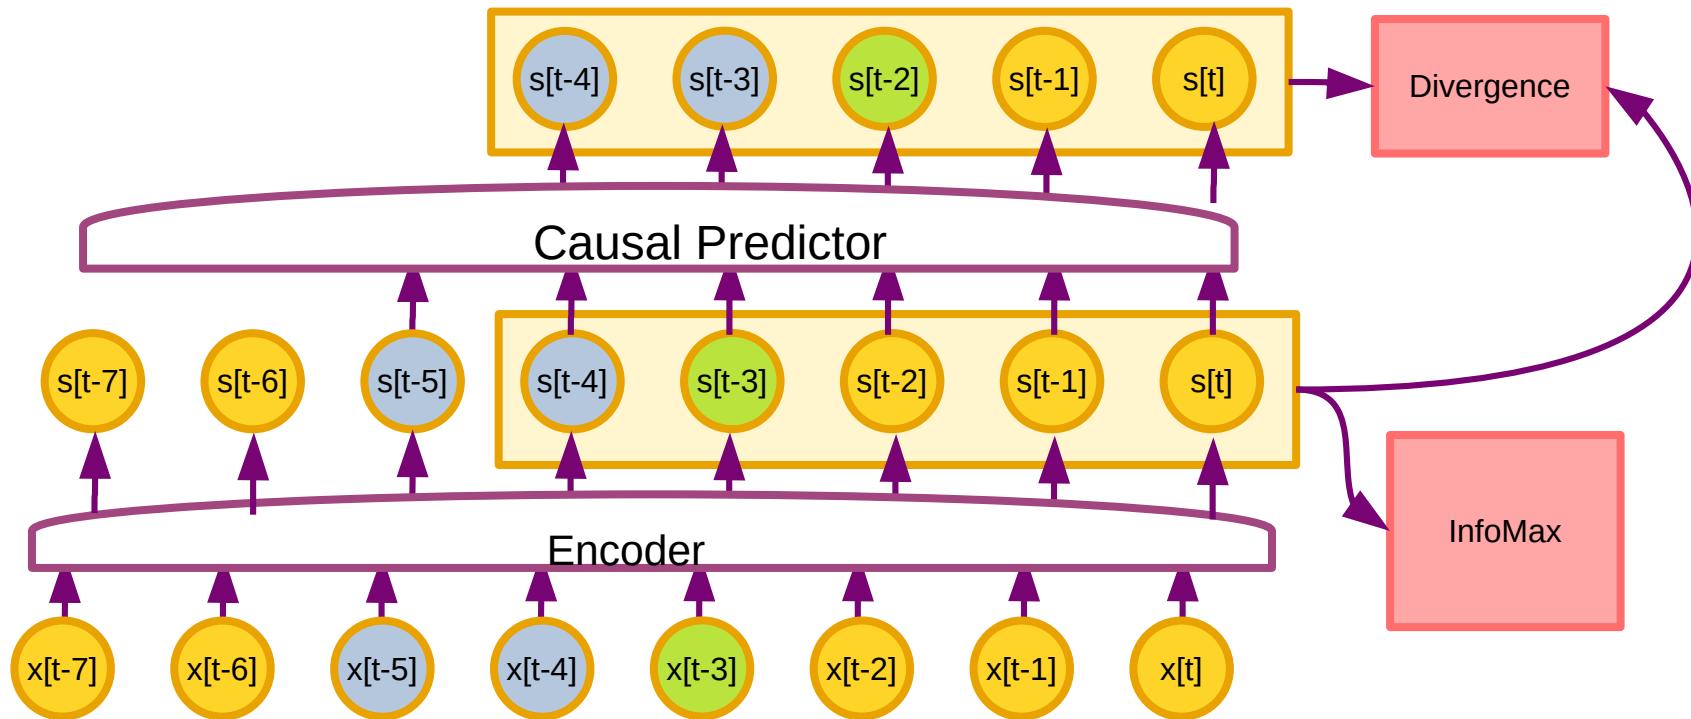

Infomax-Regularized Sequence-Level JEPA

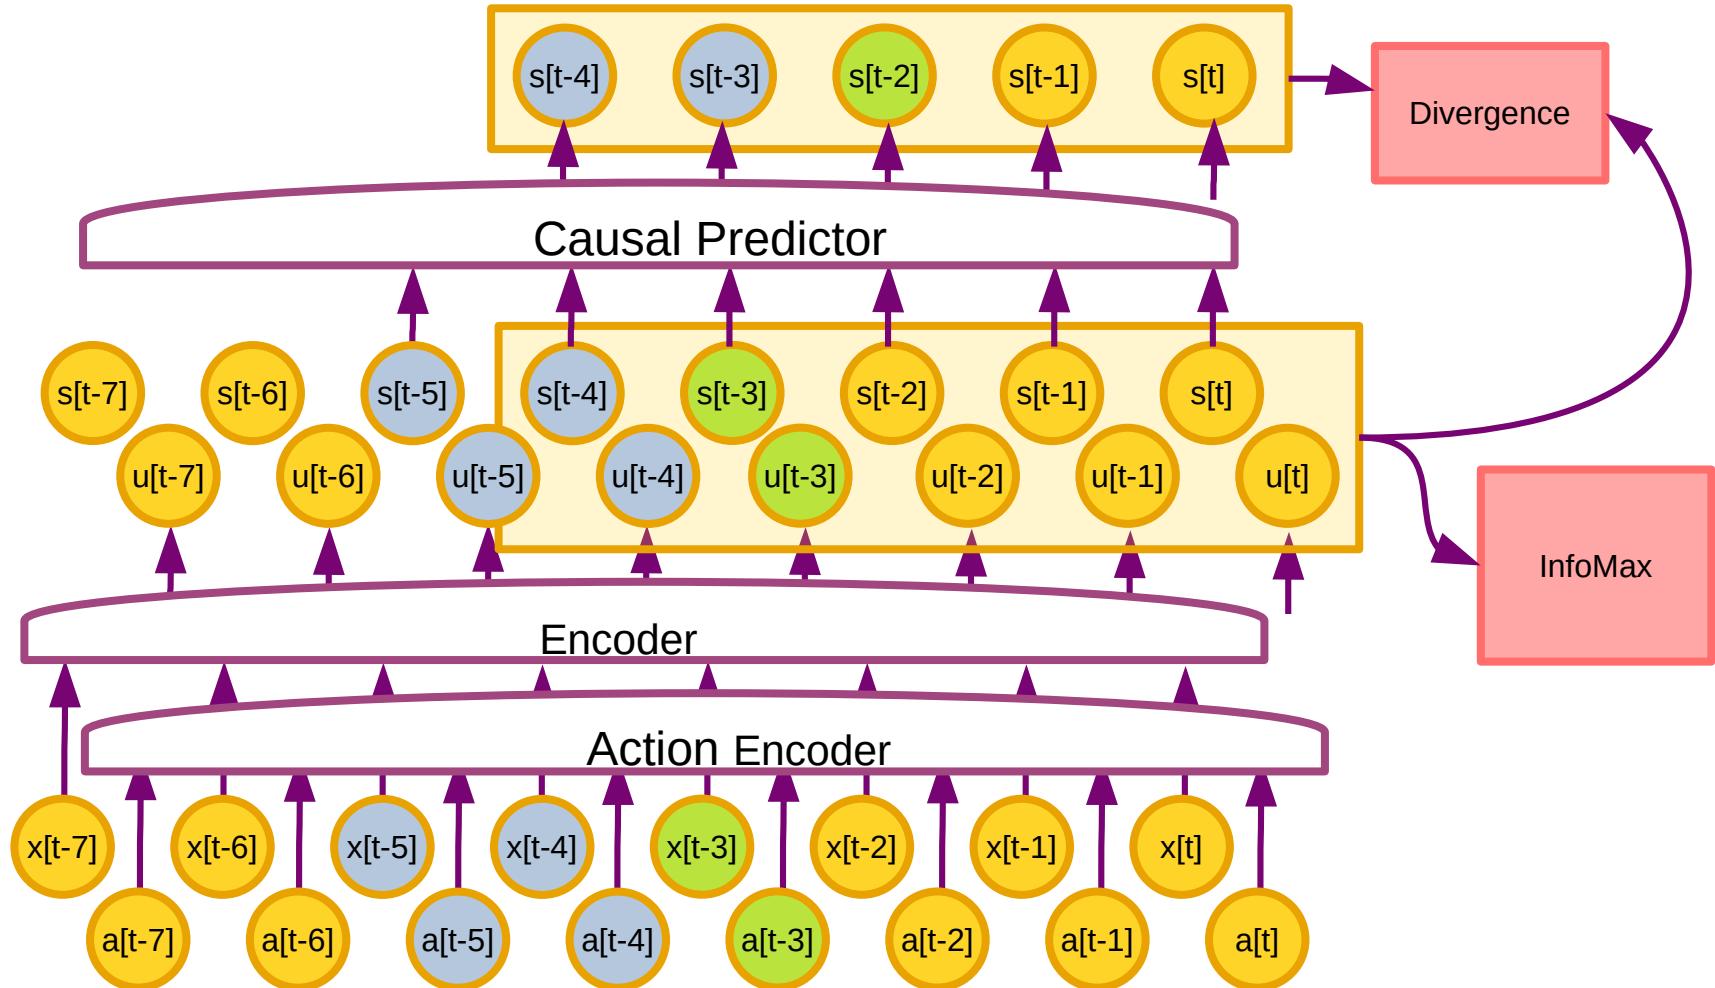

- ▶ Scalable architecture
- ▶ Causal Predictor
 - ▶ Trained as an auto-encoder
- ▶ Collapse Prevention with InfoMax
 - ▶ e.g. VCReg, MCR2, MMCR + others
- ▶ Encoder with limited receptive field
 - ▶ Bounded on the right

Training a Sequence-Level JEPA

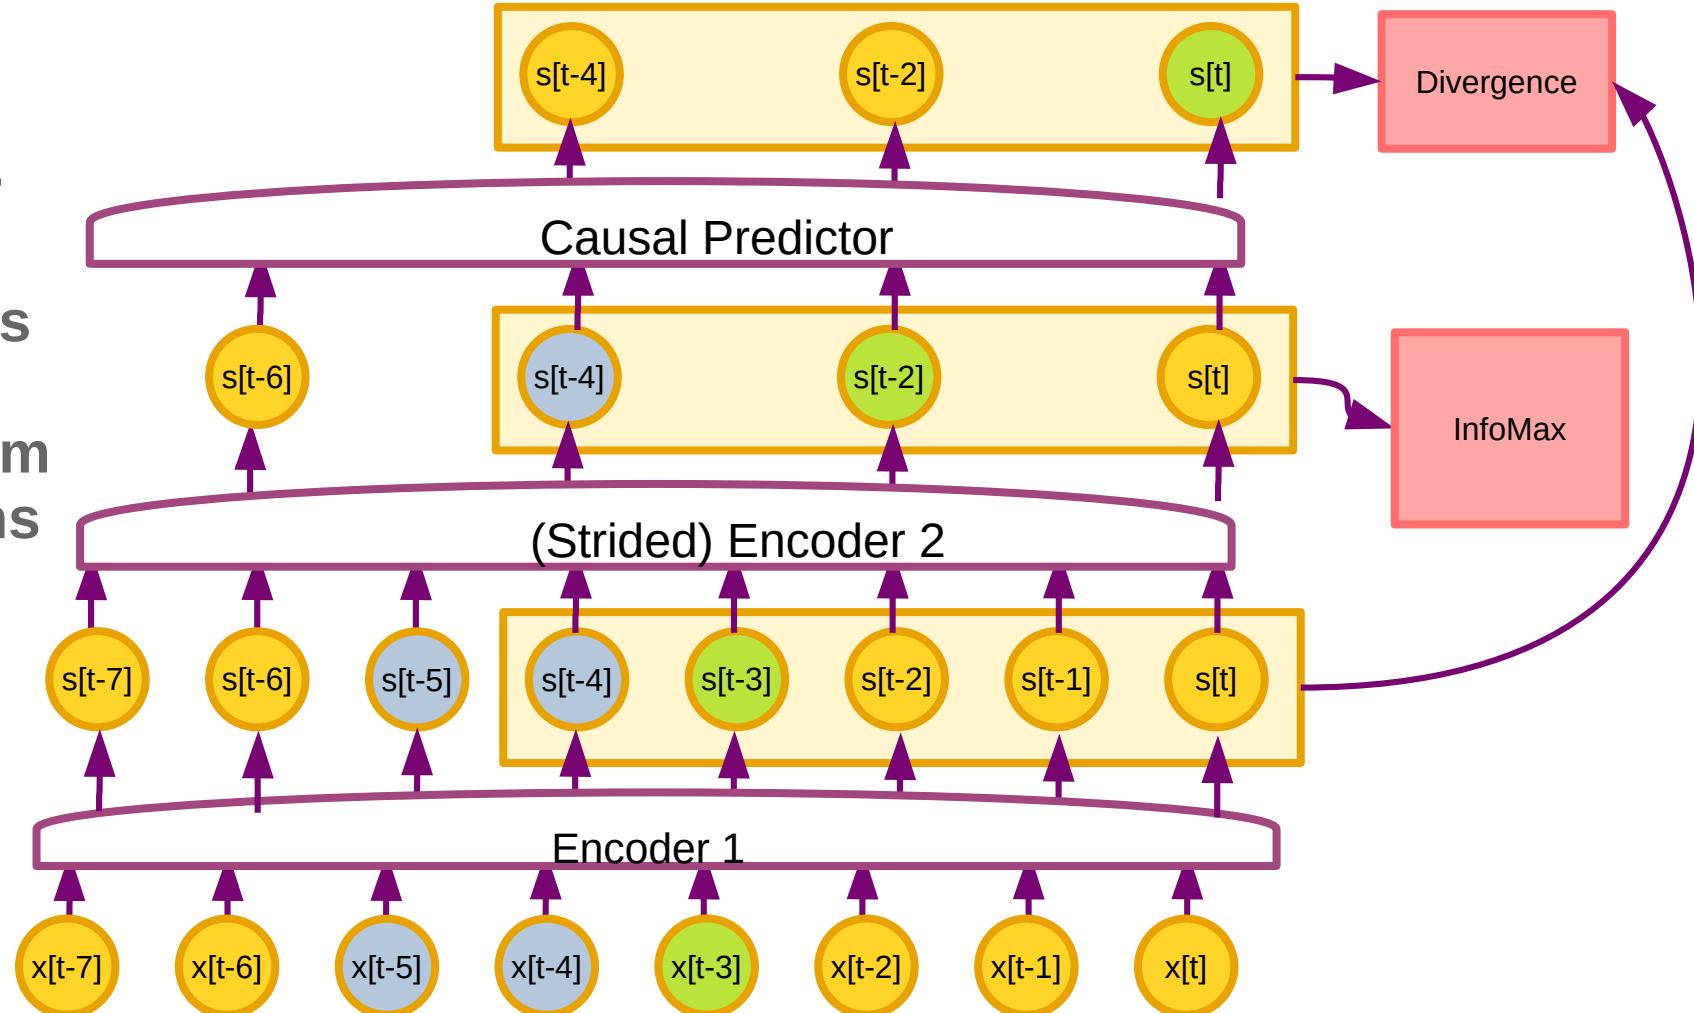

Training an Action-Conditioned Sequence-Level JEPA

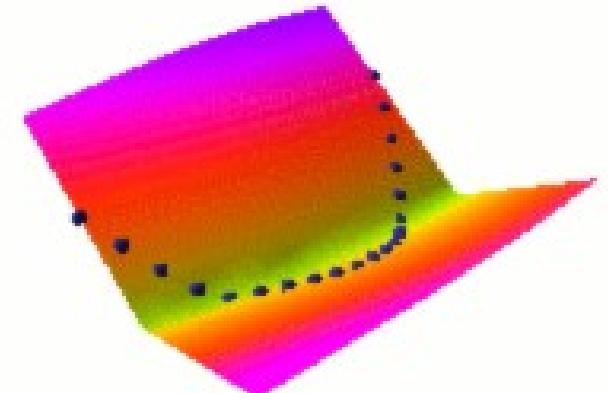

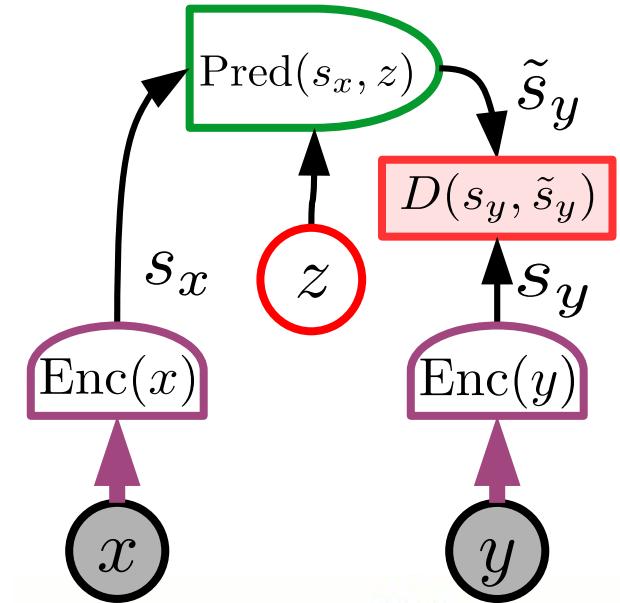

Hierarchical JEPA Architecture and Training

- ▶ 2nd stage encoder
- ▶ Strided or pooled archi so as to make longer-term predictions

Recommendations:

- ▶ Abandon generative models
 - ▶ in favor joint-embedding architectures
- ▶ Abandon probabilistic model
 - ▶ in favor of energy-based models
- ▶ Abandon contrastive methods
 - ▶ in favor of regularized methods
- ▶ Abandon Reinforcement Learning
 - ▶ In favor of model-predictive control
 - ▶ Use RL only when planning doesn't yield the predicted outcome, to adjust the world model or the critic.
- ▶ **IF YOU ARE INTERESTED IN HUMAN-LEVEL AI,
DON'T WORK ON LLMs**

Problems to Solve

- ▶ **Large-scale world-model training**
 - ▶ From video, speech, text, code, dialogs, math....
- ▶ **Planning algorithms**
 - ▶ Gradient-based methods, ADMM, gradient-free methods for discrete search
- ▶ **JEPA with latent variables**
 - ▶ Learning and planning in non-deterministic environments
 - ▶ Latent variable regularization to prevent collapse
- ▶ **Planning in the presence of uncertainty**
 - ▶ Mixed gradient-based / combinatorial optimization
- ▶ **Herarchical planning**
- ▶ **Very large-scale differentiable associative memories**

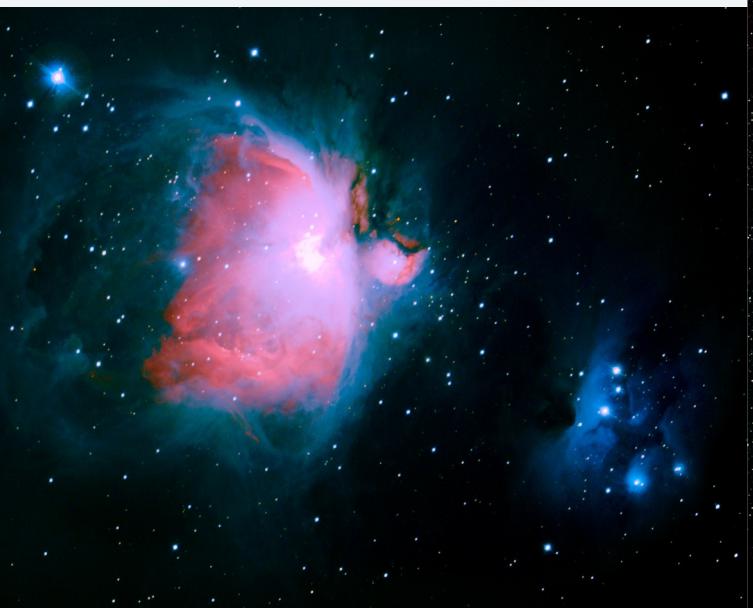

Problems to Solve

- ▶ **Mathematical Foundations of Energy-Based Learning and inference**
 - ▶ The geometry of energy surfaces, scaling laws, bounds...
 - ▶ How to maximize information content or minimize low-energy volume?
- ▶ **Learning Cost Modules (Inverse RL)**
 - ▶ Energy-based approach: give low cost to observed trajectories
- ▶ **Planning with inaccurate world models**
 - ▶ Preventing bad plans in uncertain parts of the space
- ▶ **Exploration to adjust the world models**
 - ▶ Intrinsic objectives for curiosity, play
- ▶ **New objectives to drive SSL**
 - ▶ Driving SSL to focus on interesting or useful features

Future Universal Virtual Assistants

- ▶ All of our interactions with the digital world will be mediated by AI assistants.
- ▶ They will constitute a **repository of all human knowledge and culture**
- ▶ They will constitute a shared infrastructure
Like the Internet today.
- ▶ **These AI platform MUST be open source**
- ▶ We need a diverse set of AI assistants for the same reasons we need a free press: linguistic, cultural, & value system diversity.
- ▶ Culture & knowledge cannot be controlled by a few companies on the West Coast of the US or in China.
- ▶ **Open source AI platforms are necessary**

Thank you!
